

# TRITAN

**PRECISION BEARINGS AND POWER TRANSMISSION COMPONENTS**

Your Link to Quality

## Foreword

The most up to date global research data, as well as the latest International Standards Organization (ISO) documents, were consulted in preparation of this improved edition of the TRITAN Bearings and Power Transmission Components Catalog.

The catalog includes the full range of the company's standard manufacturing program. Because of the wide range of products illustrated in the catalog, the great majority of the needs of TRITAN customers can be accommodated. TRITAN bearings are manufactured in accordance with the ISO 9001 quality standards, with basic dynamic and static load ratings meeting ISO standards.

TRITAN is a world class manufacturer with more than 25 years experience in production of rolling

bearings. Over the years, we have continually increased the quality of our bearings so that today, our products are recognized as being highly ranked in technical proficiency. We use the latest technologies to increase the life expectancy and performance of our bearings, which are made of high accuracy bearing steel with careful adherence to lubrication requirements.

All data included in this catalog is based on current production. We reserve the right to make any changes that may be necessitated by future technological advances.

We strive for maximum customer satisfaction and we assure you that we will do everything possible to meet the needs of our customers.

## Table of Contents

### Section 1

#### 1. Engineering

Selection of Bearing Type .....	9
Selection of Bearing Size.....	11
Bearing Tolerances.....	23
Bearing Lubrication.....	29
Bearing Designations.....	37
Mounting and Dismounting.....	39

#### 2. TRITAN Bearing Production

Deep Groove Ball Bearings.....	45
Angular Contact Ball Bearings .....	78
Self-Aligning Ball Bearings .....	82
Thrust Ball Bearings.....	83
Spherical Roller Bearings .....	92
Cylindrical Roller Bearings .....	99
Needle Roller Bearings.....	101
Cam Followers/Yoke Rollers.....	109
Tapered Roller Bearing.....	115
Mounted Units.....	119
Insert Bearings.....	166

Washdown Units & Inserts.....	177
Rubber Mounted Cartridge Units.....	193
Farm Implement & Disc Harrow Bearings.....	196
Special Purpose Bearings.....	199
Split Housings for Spherical Roller (SAF).....	200
Bearings Accessories.....	202
Spherical Plain Bearings.....	209
Rod Ends.....	225

### Section 2

#### 1. TRITAN Precision Power Transmission Components

Precision Chain Technology.....	236
ANSI Precision Roller Chain.....	240
Corrosion Resistant Roller Chain (Stainless Steel, Nickel plated, Dacromet coated).....	244
ISO (BS) Precision Roller Chain.....	245
Precision Conveyor Chain.....	246
Leaf Chain.....	248
Sprockets.....	250
Idlers.....	304
Sheaves.....	313
Bushings.....	324
Shaft Collars.....	330
Jaw Couplings.....	336

## Bearing designations beginning with numbers

Prefix	Series Description	Page #
12, 22	Self Aligning Ball Bearing	82
16	Deep Groove Ball Bearing - Inch	68
20..F, 20..K, 20..N	Agricultural Ball Bearing	199
212, 213, 222, 223, 230, 231, 232, 240	Spherical Roller Bearing	91
2900	Thrust Ball Bearing	90
30, 52, 53	Double Row Angular Contact Ball Bearing	80
302, 303, 313, 320..X, 322, 323	Metric Tapered Roller Bearing	115
3900	Thrust Ball Bearing	90
60, 62, 63, 69	Miniature Ball Bearing - Metric	72
60, 62, 63, 64	Deep Groove Ball Bearing	52
617, 618, 619	Deep Groove Ball Bearing - Narrow Series	52
72B, 73B, 72BMG, 73BMG	Angular Contact Ball Bearing	78
900	Thrust Ball Bearing	89

## Bearing designations beginning with letters

Prefix	Series Description	Page #
A52	Cylindrical Roller Bearing - Removable Inner Ring	99
AN	Locknut - Inch	205
B	Ball Thrust Bearing - Flat Raceways	86
B, BH	Needle Bearing - Drawn Cup - Full Complement	101
CCF	Cam Follower - Crowned OD	110
CCYR	Yoke Roller - Crowned OD	114
CF	Cam Follower	109
CF, CF..S, CF..T, CFL..T	Rod End - Inch - Commercial - Female	229
CFE	Cam Follower - Eccentric Stud	112
CFH	Cam Follower Heavy	111
CM, CM..T, CM..S, CML..T	Rod End - Inch - Commercial - Male	228
COM	Spherical Plain Bearing - Inch - Commercial Series	213
CSA	Insert Bearing - Light Duty - Cylindrical OD - Eccentric Locking Collar	175
CSB	Insert Bearing - Light Duty - - Cylindrical OD - Set Screw	174
CYR	Yoke Roller	113
D	Ball Thrust Bearing - Banded - Single Direction	87
ER, ET..T	Insert Bearing - Standard Duty - Wide Inner Ring - Cylindrical OD - Snap Ring	176
EW	Ball Thrust Bearing - Inch - 3 Piece - Flat Raceways	84
FR	Deep Groove Ball Bearing - Inch - Flanged	66, 71
GAC	Spherical Plain Thrust Bearing - Angular Contact - Metric	220
GAZ	Spherical Plain Thrust Bearing - Angular Contact - Inch	219
C, GEH..C	Spherical Plain Bearing - Metric	214
GE..TA	Spherical Plain Bearing - Metric - High Capacity	216

Prefix	Series Description	Page #
GEH..ES	Spherical Plain Bearing - Metric - Heavy Series	215
GEM	Spherical Plain Bearing - Metric - Extended Inner Ring	218
GEZ..ES	Spherical Plain Bearing - Inch	211
GEZM..ES	Spherical Plain Bearing - Inch - Extended Inner Ring	212
GT	Ball Thrust Bearing - Inch - 3 Piece - Grooved Raceways - Single Direction	88
GW2	Agricultural Ball Bearing - Relubricable	197
GX..F	Spherical Plain Thrust Bearing - Metric - High Capacity	221
H2, H3	Adapter - Complete with Washer & Locknut	202
HC	Insert Bearing - Standard Duty - Wide Inner Ring - Eccentric Locking Collar	170
HCFLU	2 Bolt Flange - Wide Inner Ring Insert - Eccentric Locking Collar	156
HCFU	4 Bolt Flange - Wide Inner Ring Insert - Eccentric Locking Collar	142
HCP, HCP..R3	Pillow Block - Wide Inner Ring Insert - Eccentric Locking Collar	132
HCPK, HCPK..R3	Pillow Block - Low Base - Wide Inner Ring Insert - Eccentric Locking Collar	134
HF, HF..G, HFL, HFL..G	Rod End - Inch - Precision - Female	227
HM, HM..G, HML, HML..G	Rod End - Inch - Precision - Male	226
J, JH	Needle Bearing - Drawn Cup - Caged	102
JT, JTT	Needle Bearing - Drawn Cup - Caged-Sealed	102
KM	Locknut - Metric	206
L, R	Miniature Ball Bearing - Metric	72
LRSCM	AC Unit - Rubber Cartridge Unit - Cylindrical OD - Eccentric Locking Collar	193
MB	Lockwasher - Metric	208
MI	Needle Bearing - Inner Race - Inch	107
MR	Needle Bearing - Caged - Inch (Without Inner Ring)	106
N	Locknut - Inch	205
NTA	Needle Bearing - Thrust - Roller Assembly	104
R	Deep Groove Ball Bearing - Inch	66
RABR	AC Unit - Rubber Insulated Insert - Spherical OD - Eccentric Locking Collar	194
RPB	AC Unit - Pressed Steel Pillow Block - Rubber Insulated Insert	195
RC, RCB	Needle Bearing - Drawn Cup Roller Clutch	108
RCSM, RCSM..S	AC Unit - Rubber Cartridge Unit	193
SA, SA..G	Insert Bearing - Light Duty - Eccentric Locking Collar	173
SA..E, SA..ES, SAL, SAL..ES	Rod End - Precision - Metric - Male	232

Prefix	Series Description	Page #
SAA..ES, SALA..ES	Rod End - Precision - Metric - Male	232
SAF	4 Bolt Flange - Light Duty Insert - Eccentric Locking Collar	145
SAF225	Split Housed Unit complete with Bearing, Adapter, Stab Ring & LER	201
SAF5	Split Housing - Plummer Block	200
SAFL	2 Bolt Flange Unit - Light Duty Insert - Eccentric Locking Collar	158
SALF	2 Bolt Flange Unit - Light Duty Insert - Eccentric Locking Collar	160
SAP	Pillow Block - Light Duty Insert - Eccentric Locking Collar	136
SAPF	3 Bolt Round Pressed Steel Flange Unit - Light Duty Insert - Eccentric Locking Collar	150
SAPFL	2 Bolt Pressed Steel Flange Unit - Light Duty Insert - Eccentric Locking Collar	162
SAPFT	3 Bolt Triangle Pressed Steel Flange Unit - Light Duty Insert - Eccentric Locking Collar	151
SAPP	Pillow Block - Pressed Steel - Light Duty Insert - Eccentric Locking Collar	137
SB, SB..G	Insert Bearing - Light Duty - Set Screw	172
SB222	Spherical Roller Bearing - Single Row - Sealed	98
SBF	4 Bolt Flange - Light Duty Insert - Set Screw	144
SBFL	2 Bolt Flange Unit - Light Duty Insert - Set Screw	157
SBLF	2 Bolt Flange Unit - Light Duty Insert - Set Screw	159
SBLFPL	2 Bolt Thermoplastic Flange - Stainless Steel Light Duty Insert - Set Screw	188
SBLFSS	2 Bolt Stainless Steel Flange - Stainless Steel Light Duty Insert - Set Screw	182
SBP	Pillow Block - Light Duty Insert - Set Screw	135
SBPF	3 Bolt Round Pressed Steel Flange Unit - Light Duty Insert - Set Screw	150
SBPFL	2 Bolt Pressed Steel Flange Unit - Light Duty Insert - Set Screw	161
SBPFT	3 Bolt Triangle Pressed Steel Flange Unit - Light Duty Insert - Set Screw	151
SBPP	Pillow Block - Pressed Steel - Light Duty Insert - Eccentric Locking Collar	137
SI..E, SI..ES, SIL..E, SIL..ES	Rod End - Precision - Metric - Female	233
SIA..ES, SILA..ES	Rod End - Precision - Metric - Female	233
SS16	Deep Groove Ball Bearing - Inch - Stainless Steel	69
SS618, SS619, SS60, SS62, SS63	Deep Groove Ball Bearing - Stainless Steel	64
SSER	Insert Bearing - Stainless Steel - Cylindrical OD - Set Screw - Snap Ring	191
SSFR	Deep Groove Ball Bearing - Inch - Flanged - Stainless Steel	70
SSHC	Insert Bearing - Stainless Steel - Wide Inner Ring - Eccentric Locking Collar	190
SSL	Miniature Ball Bearing - Metric - Stainless Steel	72
SSLF	Miniature Ball Bearing - Metric - Stainless Steel - Flanged	72
SSR	Deep Groove Ball Bearing - Inch - Stainless Steel	70
SSRI	Miniature Ball Bearing - Inch - Stainless Steel	70
SSSB	Insert Bearing - Stainless Steel - Light Duty - Set Screw - Relubricable	192
SSUC	Insert Bearing - Stainless Steel - Wide Inner Ring - Set Screw	189
T6, T7	Cylindrical Thrust Roller Bearing	100

Prefix	Series Description	Page #
TRA, TRB, TRC, TRD	Needle Bearing - Thrust Washer	104
UC, UC..R3	Insert Bearing - Wide Inner Ring - Set Screw	166
UC..T	Insert Bearing - Wide Inner Ring - Premere-LOC Concentric Squeeze Collar	169
UCF	4 Bolt Flange - Wide Inner Ring Insert - Set Screw	138
UCF..T	4 Bolt Flange - Wide Inner Ring Insert - Premere-LOC Concentric Squeeze Collar	141
UCFB	3 Bolt Flange Bracket Unit - Wide Inner Ring Insert - Set Screw	148
UCFBPL	3 Bolt Thermoplastic Flange Bracket Unit - Stainless Steel - Set Screw	187
UCFBSS	3 Bolt Flange Bracket Unit - Stainless Steel - Set Screw	181
UCFC	4 Bolt Circle Flange - Wide Inner Ring Insert - Set Screw	146
UCFCSX	4 Bolt Circle Flange - Medium Duty - Wide Inner Ring Insert - Set Screw	147
UCFL	2 Bolt Flange - Wide Inner Ring Insert - Set Screw	152
UCFL..T	2 Bolt Flange - Wide Inner Ring Insert - Premere-LOC Concentric Squeeze Collar	155
UCFLPL	2 Bolt Thermoplastic Flange - Stainless Steel Wide Inner Ring Insert - Set Screw	186
UCFLSS	2 Bolt Stainless Steel Flange - Stainless Steel Wide Inner Ring Insert - Set Screw	180
UCFLX	2 Bolt Flange - Medium Duty - Wide Inner Ring Insert - Set Screw	154
UCFPL	4 Bolt Thermoplastic Flange - Stainless Steel Wide Inner Ring Insert - Set Screw	185
UCFSS	4 Bolt Stainless Steel Flange - Stainless Steel Wide Inner Ring Insert - Set Screw	179
UCFX	4 Bolt Flange - Medium Duty - Wide Inner Ring Insert - Set Screw	140
UCP, UCP..R3	Pillow Block - Wide Inner Ring Insert - Set Screw	126
UCP..T	Pillow Block - Wide Inner Ring Insert - Premere-LOC Concentric Squeeze Collar	130
UCPA	Tapped Base Pillow Block - Domestic Dimensions - Wide Inner Ring Insert - Set Screw	131
UCPAPL	Tapped Base Thermoplastic Pillow Block - Stainless Steel Wide Inner Ring Insert - Set Screw	184
UCPASS	Tapped Base Thermoplastic Pillow Block - Stainless Steel Wide Inner Ring Insert - Set Screw	178
UCPK	Pillow Block - Low Base - Wide Inner Ring Insert - Set Screw	129
UCPPL	Pillow Block Thermoplastic - Stainless Steel Wide Inner Ring Insert - Set Screw	183
UCPSS	Pillow Block - Stainless Steel Wide Inner Ring Insert - Set Screw	177
UCPX	Pillow Block - Medium Duty - Wide Inner Ring Insert - Set Screw	128
UCST	Take Up Unit - Wide Slot - Wide Inner Ring Insert - Set Screw	163
UCT	Take Up Unit - Wide Inner Ring Insert - Set Screw	165
UCX	Insert Bearing - Medium Duty - Wide Inner Ring - Set Screw	168
W	Lockwasher - Inch	207
W	Ball Thrust Bearing - Inch - 3 Piece - Grooved Raceways	83
W2..PP	Agricultural Ball Bearing - Triple Lip Sealed	76
W2, W3..PP	Deep Groove Ball Bearing - Cartridge Type - Domestic Width - 2 Rubber Seals	76
W52	Double Row Angular Contact Ball Bearing - Wide	80
XW	Ball Thrust Bearing - Inch - 3 Piece - Grooved Raceways	85

## Power Transmission designations beginning with numbers

Prefix	Series Description	Page #
04B, 05B, 06B, 08B	Precision ISO (BS) Roller Chain	245
06A, 06B, 06BS, 08A, 08B, 08BS	Sprocket - ISO (BS)	305
10A, 10B, 10BS, 12A, 12B, 12BS, 16A, 16B, 16BS	Sprocket - ISO (BS)	307
1VP, 2VP	Variable Pitch Sheave	322
20A, 20B, 20BS, 24B, 24BS	Sprocket - ISO (BS)	310
25-1, 25-2	Precision ANSI Roller Chain	238
25A, 25B, 25BS	Sprocket - ANSI	252
2AK, 2BK	Two Groove Cast Iron Sheave for "4L" or "A" Belts and "5L" or "B" Belts	315
35-1, 35-2	Precision ANSI Roller Chain	238
35A, 35B, 35BS, 35JA, 35SH	Sprocket - ANSI	254
35BB, 40BB	Sprocket - Idler	304
40-1, 40-2, 40-3	Precision ANSI Roller Chain	238
40A, 40B, 40BS, 40BTL, 40JA, 40SDS, 40SK	Sprocket - ANSI	258
41-1	Precision ANSI Roller Chain	238
41A, 41B, 41BS	Sprocket - ANSI	256
50-1, 50-2, 50-3	Precision ANSI Roller Chain	238
50A, 50B, 50BS, 50BTL, 50SDS, 50SH, 50SK	Sprocket - ANSI	266
50BB	Sprocket - Idler	304
60-1, 60-2, 60-3	Precision ANSI Roller Chain	238
60A, 60B, 60BS, 60BTL, 60SDS, 60SF, 60SH, 60SK	Sprocket - ANSI	274
60BB, 80BB	Sprocket - Idler	304
80-1, 80-2, 80-3, 80-4	Precision ANSI Roller Chain	238
80A, 80B, 80BS, 80BTL, 80Q, 80SDS, 80SF, 80SH	Sprocket - ANSI	282
100-1, 100-2, 100-3	Precision ANSI Roller Chain	239
100A, 100B, 100BS, 100BTL, 100E	Sprocket - ANSI	289
120-1, 120-2, 120-3	Precision ANSI Roller Chain	239
120A, 120B, 120BS, 120BTL, 120E, 120F	Sprocket - ANSI	293
140-1, 140-2	Precision ANSI Roller Chain	239
160-1, 160-2	Precision ANSI Roller Chain	239
180-1, 180-2	Precision ANSI Roller Chain	239
200-1, 200-2	Precision ANSI Roller Chain	239
240-1	Precision ANSI Roller Chain	239
1008, 1108, 1210, 1310, 1610, 1615, 2012, 2517, 2525, 3020, 3030	Tapered Bushing	324

## Power Transmission designations beginning with letters

Prefix	Series Description	Page #
A20	Precision Double Pitch Conveyor Chain	246
AK	Single Groove Cast Iron Sheave for "4L" or "A" Belts	314
BK	Single Groove Cast Iron Sheave for "4L" or "A" Belts and "5L" or "B" Belts	316
BL5, BL6	Precision Leaf Chain	248
C20, C21	Precision Double Pitch Conveyor Chain	247
D40BS	Sprocket - Double - Finished Bore	264

## Power Transmission designations beginning with letters

Prefix	Series Description	Page #
D50BS	Sprocket - Double - Finished Bore	272
D60BS	Sprocket - Double - Finished Bore	280
D80BS	Sprocket - Double - Finished Bore	288
E	QD Bushing	327
F	QD Bushing	327
H	QD Bushing - Double Split	327
J	QD Bushing	327
JA	QD Bushing	327
L	Jaw Couplings	336
SC, SC..D, SC..S, SC..SS	Shaft Collars	330
SD	QD Bushing	327
SDS	QD Bushing	327
SF	QD Bushing	327
SH	QD Bushing	327
SK	QD Bushing	327

## Selection of bearing type

Each type of bearing displays characteristic features which make it suitable for a certain application. Therefore, many bearing types and constructive versions have been developed so that they can satisfy various demands for rolling bearings. Taking into account the great number of factors to be considered when selecting a bearing type, no general rule can be given.

### Selection of bearing type, considering the load magnitude and direction

#### Radial load

Deep groove ball bearings are the most suitable types of bearings for light and moderate pure radial loads. For heavy radial load and where large-diameter shafts are used, double row cylindrical roller bearings are the adequate choice. Needle roller bearings are recommended in case of limited space and heavy loads.

#### Axial load

For pure axial loads, single direction thrust ball bearings are used in case of loads acting in one direction. For loads acting in both directions, double direction thrust ball bearings are used. Angular contact thrust ball bearings and single or double row angular contact ball bearings are used in case of light or moderate pure axial loads at moderate speeds.

For light axial loads at high speeds, deep groove ball bearings are suitable. Under the axial load, a contact angle different from  $0^\circ$  is generated in these bearings and therefore they operate as angular contact ball bearings. In order to increase axial load carrying capacity, a larger clearance should be selected (C3, C4, etc.)

For moderate axial loads at high speeds, angular contact ball bearings in tandem arrangement are used so that they can take over loads acting in both directions. Four-point contact ball bearings, QJ type, are also used.

#### Combined load

In order to carry combined radial and axial loads acting simultaneously, bearings with a contact angle different from  $0^\circ$  are used. The greater the contact angle, the greater the axial load carrying capacity.

Self-aligning ball bearings, spherical roller bearings or cylindrical roller bearings, NJ, NUP, NJ + HJ types can also accommodate combined loads of certain values. But there are some limit values of the ratio  $F_a/F_r$  which are shown in bearing tables and cannot be exceeded. Cylindrical roller bearings can carry axial loads by means of the sliding friction on ribs. For this reason, the load is limited.

Bearings which accommodate only one direction axial loads should always be mounted in pairs so that they can carry axial loads in both directions.

## Selection of bearing type considering the alignment between shaft and housing

Angular misalignments occur generally when the shaft bends under the operating load or when bearings' adjoining parts have form or position deviations.

In such cases, self-aligning ball bearings, cylindrical roller bearings or spherical roller thrust bearings should be used.

A certain bearing bent angle can compensate for errors of alignment and maximum angle values are shown for each type in the introductory texts of the table sections.

When misalignments should be compensated, radial and axial clearance are important. The larger the clearance, the greater the possibility of self-aligning.

If the misalignment exceeds the permissible values shown in the introductory texts of the bearing tables, the bearing rating life decreases. The greater the ratio  $F_r/C_{0r}$ , the shorter the rating life. If  $0, 1 < F_{0r} / C_{0r} < 3$ , the rating life decreases with about 25%.

## Selection of bearing type considering the operating temperature

Bearings are generally used up to a temperature of maximum +250°C. In case of higher temperatures, bearings with special heat treatments should be used.

Sealed bearings, 2RS type, should be used at operating temperatures up to +175°C. If this temperature is exceeded, the efficacy of lubricants is considerably reduced.

## Selection of bearing internal clearance

In most cases, while operating, bearings should have a small radial clearance that can be defined as "the possible value of displacement in radial direction of one bearing ring in relation to the other without parts deformations".

While operating, bearing internal clearance is different from the one at delivery, since the latter is reduced when mounting bearings with a certain tight fit.

Under operating conditions, internal clearance change is also caused by different temperatures between the outer and inner ring. Bearings are generally delivered with a normal radial or axial clearance according to the values shown for each rolling bearing group.

The decrease in radial clearance due to the tight fit and operating temperature is considered to be between 60-80% of the tightening value, depending on bearing series and size.

After the clearance in bearings has been decreased, a large enough operational clearance should remain so that the lubricant film shouldn't be destroyed.

Deep groove ball bearings should have an operational clearance close to zero. There may be a light preload, due to the point-contact between the rolling elements and raceways.

Small-sized cylindrical roller and needle roller bearings should have an operational clearance of 5-10 µm and larger-sized bearings a clearance of 10-30 µm.

Bearings can be produced at request, with radial and axial clearance smaller (C1 and C2) or larger (C4 and C5) than normal, so that the most favorable operating conditions for bearings should be assured.

Cylindrical and needle roller bearings can be manufactured with interchangeable rings (no special designation) and with non interchangeable rings (suffix NA).

Bearings with non interchangeable parts have a smaller radial clearance than bearings with interchangeable parts. Changing rings from one bearing to another is not allowed.

In case of bearings with interchangeable parts, the rings may be changed and the values of radial clearance will not be altered.

## Bearing types and technical characteristics

TRITAN can manufacture bearings of various types and sizes so that they can meet the customers' requirements assuring a proper reliability for various applications.

Bearing type is selected depending on the technical characteristics required by a certain application.

A suggestive graphic symbol has been determined for each main technical characteristic. Thus, a proper bearing for each purpose can be easily chosen. According to the specifications in this catalog, the proper type and size of bearing can be selected, together with all manufacturing and operating technical conditions.

## Selection of bearing size

The size of a bearing is selected considering the load in the used rolling bearing and also depends on the operational rating life and prescribed operating safety.

### Basic load ratings

The basic dynamic load rating  $C_r$  is used to calculate bearing dimensions while rotating under load. It expresses the bearing admissible load which will give a basic rating life up to 1000 000 revolutions.

The basic dynamic load ratings of TRITAN bearings have been determined in accordance with international standard ISO 281. The values are given in bearing tables.

Considering the basic dynamic load rating, the service time until the fatigue of the material is calculated, determining the calculated life rating.

Basic static load rating  $C_{0r}$  is considered in case of low speeds, low oscillating movements or in the stationary case.

The basic static load rating is defined in accordance with ISO 76, as the load acting upon the stationary bearing. It corresponds to a calculated contact stress in the center of the contact area between the most heavily loaded rolling element and the raceway, of:

- 4 600 MPa for self-aligning ball bearings,
- 4 200 MPa for all other ball bearings,
- 4 000 MPa for all roller bearings.

This stress produces a permanent deformation of the rolling element and raceway which is about 0,0001 of the rolling element diameter. The loads are pure radial for radial bearings and pure axial for thrust bearings.

### Bearing life

The life of a rolling bearing is defined as the number of revolutions or the number of operating hours, which the bearing is capable to endure, before the first sign of fatigue occurs on one of its rings, on the raceway or the rolling elements.

If we want to consider only the fatigue on the bearing operating surfaces, the following conditions have to be observed:

1. The forces and speeds considered when calculating the bearing should correspond to the real operating conditions.
2. Proper lubrication should be assured during the entire operating period.
3. If the bearing carries a light load, its failure is generated by the wear.
4. Experience showed that the failure of many bearings was caused by other reasons than fatigue, such as: selection of an inadequate bearing type in a bearing joint, improper operation or lubrication, outer particles in bearing etc.

### Basic rating life

The basic rating life of a single bearing or of a group of apparently identical bearings operating under identical conditions, is the life corresponding to a reliability of 90%.

The average life of a group of bearings is approximately five times longer than the basic rating life.

Basic rating life is marked with  $L_{10}$  (millions of revolutions) or  $L_{10h}$  (operating hours).

$L_{10}$  can be calculated using the equation:

$$L_{10} = \left( \frac{C}{P} \right)^p, \text{ where:}$$

- $L_{10}$  - basic rating life, millions of revolutions,
- $C$  - basic bearing load rating, kN,
- $P$  - equivalent dynamic applied bearing load, kN,
- $p$  - exponent of the life equation with the following values:
  - $p = 3$  - for ball bearings
  - $p = 10/3$  - for roller bearings

The equivalent dynamic bearing load, respectively the radial and axial load, acting simultaneously can be calculated using the following equations (applicable to ball and roller radial bearings):

$$P_r = F_r, \text{ kN, - for pure radial load}$$

$$P_r = X F_r + Y F_a, \text{ kN, - for combined load}$$

For thrust ball bearings, the following equations can be used:

$$P_a = F_a, \text{ kN, - for pure axial load}$$

$$P_a = X F_r + Y F_a, \text{ kN, - for combined load}$$

**where:**

$F_r$  = the radial component of the load, kN

$F_a$  = the axial component of the load, kN

In the texts preceding the bearing tables, for some groups of bearings there are given details for determining the equivalent load. Values of the coefficients X and Y can be found in tables.

For bearings operating at constant speed, the basic rating life expressed in operating hours can be calculated using the equation:

$$L_{10h} = \frac{1\,000\,000}{60n} (C/P)^P \quad \text{sau} \quad L_{10h} = \frac{16\,666}{n} (C/P)^P$$

**where:**

n = rotation speed, r/min

Values of the basic rating life  $L_{10}$  (millions of revolutions) as a function of the ratio C/P can be found in the table 2.1.

Values of the basic rating life  $L_{10h}$  (operating hours) as a function of the ratio C/P and speed n can be found in table 2.2 for ball bearings and table 2.3 for roller bearings.

When determining the bearing size it is necessary to base the calculations on the rating life corresponding to the purpose of operation.

It usually depends on the machine type, service life and the requirements regarding operational safety.

Approximate values of the service life for various classes of machines and equipments for general purposes are given in table 2.4

The basic rating life  $L_{10h}$  of the bearings can be determined as a function of service life, using the life calculation chart on page 16.

The basic rating life of road and rail vehicle bearings, for wheel - axle bearings, is expressed as a function of the wheel diameter and covered distance (km), using the equation:

$$L_{10} = \frac{1\,000}{\pi D} L_{10s} \quad \text{respectively:} \quad L_{10s} = \frac{\pi D}{1\,000} L_{10}$$

**where:**

$L_{10}$  - basic rating life, millions of revolutions

$L_{10s}$  - service life distance, millions of kilometers

D - wheel diameter, m

Approximate values for the service life distance (kilometers covered), in case of light loaded cars and rail vehicles are given in table 2.5.

**Load ratio C/P for various life values  $L_{10}$   
(millions of revolutions)**

**Table 2.1**

Basic rating life calculation chart

**Example:**

1. It is required to determine the size of a deep groove ball bearing single row, considering the following conditions:

- Basic rating life  $L_{10h} = 25\,000$  operating hours
- Rotational speed  $n = 1\,000$  r/min
- Load in bearing  $F_r = 5$  kN

The chart shows that  $C/P = 11,6$ ;  $C = 11,6$ ,  $P = 11,6 \times 5 = 58$  kN. In the catalog on page 58, you can select the bearing 6310 type with the following characteristics:  $C_r = 61,8$  kN;  $n = 7\,000$  r/min.

## Recommended basic rating lives for general purpose machines

**Table 2.4**

Application	Recommended basic rating life $L_{10h}$ (operating hours)
Household machines, technical apparatus for medical use, instruments, agricultural machines:	300...3 000
Machines used for short periods or intermittently: electric hand tools, cranes, lifting tackles in workshops, building machines:	3 000...8 000
Machines used intermittently or for short periods with high operational reliability: lifts, small cranes:	8 000...12 000
Machines for use 8 hours/day but not always at full capacity: machines for general purposes, electric motors for industrial use, rotary crushers, gear drives for general purposes:	10 000...25 000
Machines operating 8 hours/day at full capacity: machine tools, woodworking machines, large cranes, printing equipment, ventilators, separators, centrifuges:	20 000...30 000
Machines for continuous use 24 hours/day: Rolling mill gear units, medium sized electrical machinery, compressors, pumps, textile machines, mine hoists:	40 000...50 000
Hydraulic machines, rotary furnaces, capstans, propulsion machinery for sea vessels (propellers for sea vessels):	50 000...10 0000
Machines for continuous use 24 hours/day with high reliability: large electric machinery, mine pumps and mine ventilators, power station plants, machines for cellulose industry, pumping units:	100 000...

**Values for basic rating life  $L_{10s}$**

**Table 2.5**

Type of vehicle	$L_{10s}/10^6$ km
Wheel hub bearings for road vehicles	
- light loaded cars	0,3
- trucks, buses	0,6
Axlebox bearings for rail vehicles:	
goods wagons (according to UIC)	0,8
suburban vehicles, trams	1,5
long distance passenger carriages	3
motorailers	3-4
Diesel and electric locs	3-4

Complete oscillation = 4 from point 0 to point 4

In case of bearings which do not rotate but oscillate from a central position through an angle, as shown in fig. 1, basic rating life can be determined as follows:

$$L_{10osc} = \frac{180}{2\gamma} L_{10}$$

**where:**

- $L_{10osc}$  - basic rating life, millions of cycles
- $\gamma$  - oscillation amplitude (angle of maximum deviation from center position), degrees.

If the amplitude of oscillation is very small, it can be ignored for basic rating life determination.

### Fluctuating dynamic load and speeds

In many cases, in operation speed and magnitude of load fluctuate. Therefore, a mean dynamic load is to be calculated.

The load acting on the bearing can vary as shown in fig. 2-a and 2-b. In this case, the mean load can be determined using the equation:

$$F_m = \sqrt[p]{\frac{F_1^p n_1 + F_2^p n_2 + \dots + F_n^p n_n}{n}}$$

where:

- $F_m$  - constant mean load, kN
- $F_1, F_2, \dots, F_n$  - constant load during  $n_1, n_2, \dots, n_n$  revolutions, kN
- $n$  - total number of revolutions ( $n = n_1 + n_2 + \dots$ ) during which loads  $F_1, F_2, \dots$  act
- $p$  - exponents -3  
- for ball bearings,  
- 10/3 - for roller bearings.

If the bearing speed is constant and the magnitude of the load is between the minimum value  $F_{min}$  and a maximum value  $F_{max}$  as shown in fig. 3 a and b, the mean load can be obtained from:

Fig. 2

$$F_m = \frac{F_{min} + 2F_{max}}{3}, \text{ kN}$$

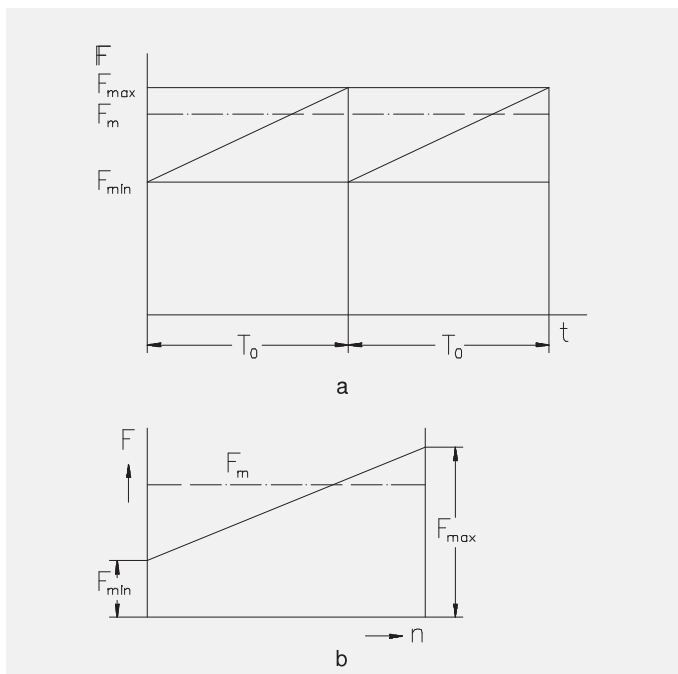

Fig. 3

If the external radial load consists of a load  $F_1$  which is constant in magnitude and direction and a load  $F_2$  which is variable in direction and constant in magnitude ( $F_1$  and  $F_2$  acting in the same plane) as shown in fig. 4, the mean load can be determined using the equation:

$$F_m = f_m (F_1 + F_2), \text{ kN}$$

Fig.4

Values for the factor  $f_m$  can be obtained from fig. 5. In case of sinusoidal movement as it is shown in fig. 6, the mean load can be obtained from:

$$F_m = \sqrt{\frac{p}{3\pi}} F_{max}, \text{ kN},$$

$$F_m \approx 0,75 F_{max}, \text{ kN}, \text{ for ball bearings}$$

$$F_m \approx 0,77 F_{max}, \text{ kN}, \text{ for roller bearings}$$

In case of oscillating movements with oscillating angle  $\gamma$ , as shown in fig. 7, equivalent mean load can be calculated with the equation:

$$F_m = \sqrt{\frac{\gamma}{90^\circ}} F_r, \text{ kN}$$

If the fluctuating load acts in a pure radial direction for radial bearings and in a pure axial direction for thrust bearings, the equivalent dynamic bearing load will be:  $P_r = F_m$ .

For combined loads, with radial load  $F_r$  and axial load  $F_a$  constant in direction and magnitude, the equivalent dynamic load can be calculated using the equation:

$$P_r = X F_r + Y F_a, \text{ kN}$$

Fig. 5

Fig. 6

Fig. 7

In case of combined loads, with radial and axial loads changing in time, ratio  $F_r/F_a$  being constant, the equivalent dynamic load can be calculated by:

$$P_m = XF_{rm} + YF_{am}$$

where:

- $P_m$  - equivalent mean dynamic load, kN,
- $F_{rm}$  - radial mean load, kN,
- $F_{am}$  - axial mean load, kN,
- $X, Y$  - factors of radial and axial load.

In case the direction and magnitude of the load change in time and speeds fluctuate in time, the equivalent mean dynamic load will be calculated using the equation:

$$P_m = \sqrt[p]{\frac{P_1^p n_1 + P_2^p n_2 + \dots + P_n^p n_n}{n}}$$

where:

- $P_m$  - equivalent mean dynamic load, kN
- $P_1$  - equivalent dynamic load for  $n_1$  revolutions, kN
- $P_2$  - equivalent dynamic load for  $n_2$  revolutions, kN
- $P_n$  - equivalent dynamic load for  $n_n$  revolutions, kN
- $n_1$  - number of revolutions for load  $P_1$
- $n_2$  - number of revolutions for load  $P_2$
- $n_n$  - number of revolutions for load  $P_n$
- $n$  - number of revolutions ( $n = n_1 + n_2 + \dots + n_n$ )
- $p$  - exponent:
  - 3 - for ball bearings,
  - 10/3 - for roller bearings

### Basic dynamic load of a bearing group

In case of ball and roller bearings especially, a bearing group of the same type mounted close together is required, so that heavy radial loads can be carried.

In order to take over the load uniformly these bearings should be mounted in order to equal the diameter deviations to the radial clearances.

These deviations must be kept below 1/2 of the admitted tolerance class.

Basic dynamic load for a bearing group, as a function of the basic load of the single bearing, can be calculated using the equation:

$$C_{ri} = C_r i^n,$$

where:

- $C_{ri}$  - basic dynamic load of the bearing group, kN,
- $C_r$  - basic dynamic load of the single bearing, selected from the tables,
- $i$  - number of bearings of the same type, mounted close together,
- $n$  - exponent depending on the bearing type:
  - 0,7 - for ball bearings
  - 7/9 - for roller bearings

Values of  $i^n$  are given in table 2.6.

i	Values for $i^n$	
	$i^{0,7}$	$i^{7/9}$
2	1,62	1,71
2	2,16	2,35
4	2,64	2,94

The equivalent dynamic load for each group of bearings is calculated considering the specifications in the introductory text preceding the respective group.

## Adjusted rating life

Basic rating life  $L_{10h}$  is often satisfactory for bearing performances. This life means a reliability of 90% for material and a modern and usual manufacturing technology, as well as for conventional operating conditions.

For a reliability over 90% (100-n)%, ISO recommends steels elaborated in better conditions, high level manufacturing technologies and specific operating conditions. In this case, adjusted rating life can be calculated as follows:

$$L_{na} = a_1 a_2 a_3 L_{10} \text{ or}$$

$$L_{na} = a_1 a_2 a_3 \left( \frac{C}{P} \right)^p$$

where:

- $L_{na}$  - adjusted rating life, millions of revolutions
- $a_1$  - life adjustment factor considering reliability
- $a_2$  - life adjustment factor considering the material and manufacturing conditions
- $a_3$  - life adjustment factor considering the operating conditions.

In case of life adjustment factors  $a_1$ ,  $a_2$ ,  $a_3$  greater than 1, when calculating adjusted rating life, prudence and familiarity with bearing manufacturing and operating conditions, including shaft bending and housing stiffness are recommended.

### Life adjustment factor $a_1$ for reliability

The bearing failure, caused by fatigue, is subjected to certain statistic laws. Therefore, this fact is recommended to be considered when calculating the bearing life.

Values of the life adjustment factor  $a_1$  for reliabilities over than 90% are given in table 2.7.

Values for factor $a_1$		
Reliability, %	$L_{na}$	$a_1$
90	L10a	1
95	L5a	0,62
96	L4a	0,53
97	L3a	0,44
98	L2a	0,33
99	L1a	0,21

### Life adjustment factor $a_2$ for material

Life adjustment factor  $a_2$  takes into account the properties of the material, heat treatment of the steel and manufacturing technologies. For TRITAN bearings,  $a_2 = 1$  is recommended.

### Life adjustment factor $a_{23}$ for operating conditions

The longest life of a bearing can be reached in case of hydrodynamic lubrication, namely where there is no direct contact between rolling elements and raceway due to the lubricant film. In this field, many studies have been done by world leading bearing manufacturing companies. These studies showed that there is relationship between life adjustment factor  $a_2$  for material and life adjustment factor  $a_3$  for operating conditions. Preferably these factors should be unified, obtaining factor  $a_{23}$ . In this case, adjusted rating life would be:

$$L_{na} = a_1 a_{23} L_{10} \text{ or } L_{na} = a_1 a_{23} L_{10h}$$

The values of  $a_{23}$  coefficient depend on the lubricant used for bearing lubrication, namely on the ratio of the oil viscosity at +40°C,  $\nu$  (initial value) to the viscosity required for adequate lubrication at the operating temperature  $\nu_1$ . The values are given in table 2.8.

Values for factor $a_{23}$									
Table 2.8									
$\frac{\nu}{\nu_1}$	0,1	0,2	0,5	1,1,5	2	3	4	5	
$a_{23}$	0,45	0,55	0,75	1,1,3	1,6	2	2,5	2,5	

The values of viscosity  $\nu_1$ , as a function of the mean bearing diameter and operating speed, are given in the diagram fig. 8.

Kinematic viscosity  $\nu$  at the temperature of +40°C can be determined from the diagram fig. 9 in accordance with ISO, if the bearing operating temperature is known.

In case of grease lubrication, calculation should be done considering the basic oil viscosity and the value of the life adjustment factor  $a_{23}$  will be smaller than 1.

Example of oil kinematic viscosity calculation for bearing lubrication:

The bearing 6212 operates at a speed of 3500 r/min and a temperature of +70°C.

Mean diameter will be:

$$0,5 (d+D) = 0,5 (60 + 110) = 85 \text{ mm.}$$

From the diagram fig. 9, at a temperature of +70°C for a viscosity  $\nu_1 = 8 \text{ mm}^2/\text{s}$ , the viscosity at +40°C is  $20 \text{ mm}^2/\text{s}$  (cSt).

In this case, an oil should be selected in accordance with ISO VG22 with kinematic viscosity limits:  $\nu_{\min} = 19,8 \text{ mm}^2/\text{s}$  (cSt) and  $\nu_{\max} = 24,2 \text{ mm}^2/\text{s}$  (cSt).

In case of bearing operating at temperatures higher than +150°C, an adjustment factor  $f_t$  for temperature should be added to the life adjustment factor  $a_{23}$ . Adjusted rating life will be:

$$L_{na} = a_1 a_{23} f_t L_{10} \text{ or } L_{na} = a_1 a_{23} f_t L_{10h}$$

Values for the life adjustment factor  $f_t$  for temperature are given in table 2.9.

Fig. 8

Values for operating temperature factor  $f_t$

Table 2.9

Operating temperature, t °C	150	200	250	300
$f_t$		0,73	0,42	0,22

## Static load

When the bearing is stationary or rotates at slow movements or very low speeds (lower than 10 r/min), basic static load is not determined by the material fatigue but by permanent deformation caused at the rolling element/raceway contact.

It is also the case of rotating bearings, when they have to sustain heavy shock loads which act during a fraction of their revolution.

Generally, the value of the load may increase up to the value of the basic static load  $C_0$ , without altering the bearing operating properties.

## Equivalent static load

Combined static load (radial and axial load acting simultaneously on bearing) must be converted into an equivalent static bearing load. This is defined as the load (radial for radial bearings and axial for thrust bearings) which if applied, would cause the same permanent deformation in the bearing as the real load operating upon it.

Equivalent static load is obtained from the general equation:

$$P_0 = X_0 F_r + Y_0 F_a, \text{ kN}$$

where:

- $P_0$  - equivalent static bearing load, kN,
- $F_r$  - radial component of the heaviest static load, kN,
- $F_a$  - axial component of the heaviest static load, kN,
- $X_0$  - radial load factor of the bearing,
- $Y_0$  - axial load factor of the bearing.

Data needed to calculate equivalent static load can be found in text and in bearing tables.

## Requisite basic static load rating

When determining bearing size on the basis of the static load, a static safety factor  $s_0$  is used.

The requisite basic static load is calculated using the equation:

$$C_{r0} = s_0 P_{r0}, \text{ kN},$$

Fig. 9

where:

- $C_{r0}$  - basic static load rating, kN,
- $s_0$  - static safety factor, table 2.11,
- $P_{r0}$  - equivalent static load, kN.

At high temperatures, life of the material decreases and the static load carrying capacity of bearings is reduced.

For high temperatures, basic static load is calculated using the equation:

$$C_{r0} = f_{0t} s_0 P_{r0}, \text{ kN}$$

The values of factor  $f_{0t}$  depending on temperature is given in table 2.10

Values for temperature factor  $f_{0t}$

Table 2.10				
Operating temperature, t °C	150	200	250	300
$f_{0t}$	1	0,95	0,85	0,75

## Non-rotating bearings

In case of non-rotating bearings, the values of static safety factor  $s_0$ , for certain applications are given in table 2.11. These values are also valid for bearings with oscillating movements.

Values for static safety factor  $s_0$

Table 2.11

Application	$s_0$
Gates for barrages, dams, sluices	
Opening bridges	1,5
Crane hooks for:	
- large cranes without additional loads	1,5
- small cranes with additional dynamic loads	1,6

## Rotating bearings

In case of fluctuating or oscillating loads and especially when heavy shock loads are acting during a fraction of revolution, it is necessary to check if the bearing has the proper static load carrying capacity.

Heavy shock loads, higher than the basic static bearing load, produce permanent deformations not uniformly distributed on raceway, which influence negatively upon bearing running.

Generally, heavy shock loads cannot be exactly calculated and in certain cases they produce deformations of bearing housing and consequently an unfavorable load distribution in bearing.

When a bearing rotates under maximum load, raceway becomes uniformly deformed on all its outer surface without any imprint.

For various operating conditions, maximum load acting upon the bearing is calculated with static safety factor  $s_0$ , depending on the vibrations and shock loads.

The values of static safety factor are given in table 2.12.

For bearings with a known equivalent static load, static safety factor  $s_0$  is necessary to be checked using the equation:

$$s_0 = \frac{C_{r0}}{P_{r0}}$$

If the value of  $s_0$  is less than that recommended in table 2.12, then a bearing with a higher basic static load carrying capacity should be selected.

## Basic static load for a group of bearings

Where more bearings of the same type are mounted close together to take over a static load, the load magnitude supported by these bearings will be calculated from:

$$C_{0ri} = C_{0r} i$$

**where:**

- $C_{0ri}$  - basic static load of the bearing group,
- $C_{0r}$  - basic static load of the single bearing (from tables).
- $i$  - number of bearings.

**Values for static safety factor  $s_0$**

**Table 2.12**

Type of operation	Requirements regarding quiet running					
	Unimportant	Normal	High			
	Ball bearings	Roller	Ball bearings	Roller	Ball bearings	Roller
<b>Smooth, vibration-free</b>	0,5	1	1	1,5	2	3
<b>Normal</b>	0,5	1	1	1,5	2	3,5
<b>Heavy shock loads</b>	>1,5	>2,5	>1,5	>3	>2	>4

## Bearing Tolerances

Bearing tolerances have been internationally standardized in accordance with ISO 492, ISO 199, and ABM4.

Bearings are generally manufactured to the tolerance class P0 (ABEC 1). At request, they can also be manufactured to the tolerance classes P6 (ABEC 3), P5 (ABEC 5), P4 (ABEC 7) and P2 (ABEC 9). These bearings are used for special applications, such as very accurate shaft guidance or very high speeds.

The values of the limit deviations for these tolerance classes are given for:

- the overall dimensions of:
  - deep groove ball bearings, angular contact ball bearings, self-aligning ball bearings, spherical roller bearings, cylindrical roller bearings, needle roller bearings, tapered roller bearings,
  - tapered roller bearings with metric(mm) and inch dimensions,
  - tapered bore bearings,
  - thrust ball bearings, angular contact thrust ball bearings, cylindrical roller thrust bearings, needle roller thrust bearings,
  - mounting chamfer.

### Symbols

$d$	- nominal bore diameter or shaft washer nominal bore diameter for thrust bearings
$d_1$	- nominal diameter at the theoretical large end of the tapered bore
$d_2$	- nominal bore diameter of the shaft washer for double direction thrust bearings
$d_s$	- deviation of single bore diameter
$d_{psmax}$	- maximum bore diameter, in a single radial plane
$d_{psmin}$	- minimum bore diameter, in a single radial plane
$\Delta d_s$	- deviation of a single bore diameter $\Delta d_s = d_s - d$
$d_{mp}$	- mean bore diameter, in a single radial plane $d_{mp} = (d_{psmax} + d_{psmin})/2$
$\Delta d_{mp}$	- deviation of the mean bore diameter in a single radial plane; or deviation of the mean diameter at the theoretical small end of the tapered bore, in case of tapered bore bearings; or deviation of the mean bore diameter of the shaft washer in a single radial plane for single direction thrust bearings $\Delta d_{mp} = d_{mp} - d$
$d_{1mp}$	- mean diameter at the large theoretical end of the tapered bore in a single plane.

$\Delta d_{1mp}$	- deviation of the mean diameter at the theoretical large end of the tapered bore $\Delta d_{1mp} = d_{1mp} - d$
$\Delta d_{2mp}$	- deviation of the mean bore diameter of the shaft washer for a double direction thrust bearing, in a single radial plane
$V_{dp}$	- bore diameter variation in a single radial plane; or bore diameter variation of the shaft washer in a single radial plane, for single direction thrust bearings $V_{dp} = d_{psmax} - d_{psmin}$
$V_{d2p}$	- bore diameter variation of the shaft washer for double direction thrust bearings, in a single radial plane
$V_{dmp}$	- mean bore diameter variation (valid only for cylindrical bore) $V_{dmp} = d_{mpmax} - d_{mpmin}$
$\alpha$	- nominal half-angle of the tapered bore
$D$	- nominal outside diameter or housing washer nominal diameter
$D_1$	- nominal outside diameter of the outer ring rib
$D_s$	- single outside diameter
$D_{psmax}$	- maximum outside diameter in a single radial plane
$D_{psmin}$	- minimum outside diameter in a single radial plane
$\Delta D_s$	- deviation of the single outside diameter $\Delta D_s = D_s - D$
$D_{mp}$	- mean outside diameter, in a single plane $D_{mp} = (D_{psmax} + D_{psmin})/2$
$\Delta D_{mp}$	- deviation of the mean outside diameter in a single radial plane; or deviation of the mean diameter of housing washer in a single radial plane, for thrust bearings $\Delta D_{mp} = D_{mp} - D$
$V_{Dp}$	- outside diameter variation in a single radial plane; or housing washer diameter variation in a single radial plane for double direction thrust bearings $V_{Dp} = D_{psmax} - D_{psmin}$
$V_{Dmp}$	- mean outside diameter variation
$B$	- nominal width of the inner ring
$B_s$	- single width of the inner ring
$\Delta B_s$	- inner ring single width deviation $\Delta B_s = B_s - B$
$V_{B_s}$	- inner ring single width variation
$C$	- nominal width of the outer ring
$C_s$	- single width of the outer ring
$\Delta C_s$	- deviation of outer ring single width $\Delta C_s = C_s - C$

$V_{Cs}$	- single width variation of the outer ring $V_{Cs} = C_{smax} - C_{smin}$	$S_D$	- variation in inclination of outside cylindrical surface to outer ring side face
$T$	- nominal width of tapered roller bearings	$S_{ia}$	- side face runout of assembled inner ring with reference to raceway
$T_s$	- single width of tapered roller bearings	$S_{ea}$	- side face runout of assembled outer ring with reference to raceway
$\Delta T_s$	- deviation of the single width of taper roller bearings $\Delta T_s = T_s - T$	$S_i$	- thickness variation measured from middle of raceway to back seating face of shaft washer
$T_1$	- nominal width of the inner ring and tapered roller assembly	$S_e$	- thickness variation measured from middle of raceway to back face of housing washer
$T_{1s}$	- single width of the inner ring and tapered roller assembly	$\Delta H_s$	- deviation of mounting height of single direction thrust ball and roller bearings
$\Delta T_{1s}$	- deviation of the single width of inner ring and tapered roller assembly $\Delta T_{1s} = T_{1s} - T_1$	$\Delta H_{1s}$	- deviation of mounting height of thrust ball bearings with sphered housing washer
$T_2$	- nominal width of the outer ring assembly	$\Delta H_{2s}$	- deviation of mounting height of double direction thrust ball and roller bearings
$T_{2s}$	- single width of the outer ring assembly	$\Delta H_{3s}$	- deviation of mounting height of double direction thrust ball bearings with sphered housing washer
$\Delta T_{2s}$	- deviation of the single width of outer ring assembly $\Delta T_{2s} = T_{2s} - T_2$		
$K_{ia}$	- radial runout of assembled bearing inner ring		
$K_{ea}$	- radial runout of assembled bearing outer ring		
$S_d$	- side face runout with reference to bore of the inner ring

 4) Applies only to ball bearings.

## Bearing Lubrication

Safe operating and long rating life of bearings depend on the lubricant type and quality and on the lubrication method. Bearing lubrication is used for certain purposes, such as:

- to reduce friction between rolling elements and raceway, rolling elements and cage, cage and guiding ribs of rings during operation;
- to ensure anticorrosive protection of bearings;
- to reduce noise in bearing within certain limits;
- to distribute heat uniformly in contact areas and to remove it outside through lubricant circulation.

Lubricants for bearing lubrication should satisfy the following conditions:

- they should have physical and chemical stability;
- foreign mechanical substances (abrasive, metallic substances etc.) are not admitted in lubricant;
- they should have a minimal coefficient of friction;
- to be non-corrosive;
- good unctuousity (lubricating capacity).

There are two categories of lubricants used for bearing lubrication:

- fluid lubricants (oils);
- pseudoplastic lubricants (greases).

Table 5.1 shows comparison between fluid and pseudoplastic lubricants.

Although fluid lubricants have better characteristics than plastic lubricants, they cannot be used in all cases because of sealing difficulties.

### Comparative values for lubricants

**Table 5.1**

Characteristics	Lubricant Fluid	Pseudoplastic
speed	any value	low and medium
friction	low (reduced)	high
unctuousity	excellent	good
service life	long	short
cooling effect	high	low
replacement	easy	difficult

## Selection of lubricants

When selecting lubricants, much care is needed and all operating conditions and lubricant properties should be considered.

No lubrication system can be considered universal.

The most important criteria when selecting a lubricant have to be as follows:

- size of bearing
- load
- speed
- bearing operating temperature

These characteristics act upon lubricant viscosity as follows:

- the higher the bearing size, value of load and temperature, the higher the viscosity
- bearing speed acts by product  $D_m n$ , as shown in table 5.2.

### Corelation between $D_m n$ and lubricant type

**Table 5.2**

$D_m n$ over	up to	Lubricant type
–	$150 \times 10^3$	Mineral oil and grease with medium or high viscosity
$150 \times 10^3$	$300 \times 10^3$	Mineral oil with medium viscosity and grease
$300 \times 10^3$	$500 \times 10^3$	Mineral oil with low viscosity and grease
$500 \times 10^3$	$1\ 200 \times 10^3$	Mineral oil with low viscosity and lubricating equipment

## Grease Lubrication

Grease can be used to lubricate rolling bearings only when product  $D_m n \leq 500 \times 10^3$  and it offers the following advantages:

- it is more easily retained in the bearing;
- it assures anti-corrosive protection to bearing as it is water-resistant;
- low expenses for sealing.

The grease quantity to be supplied shouldn't be excessive, otherwise rotation is braked, friction increases as does operating temperature without extending the bearing rating life.

The quantity of grease that is to be inserted in bearing seating should be as follows, considering the free space inside the housing:

- $\frac{1}{2}$  ...  $\frac{3}{4}$  of the free space in the housing, in case of normal speeds;
- $\frac{1}{3}$  of the free space in the housing, in case of high speeds and speed limit;
- the whole housing space should be free, in case of low speeds and product  $D_m n < 10 \times 10^3$ .

The quantity of grease can be calculated as a function of bearing bore diameter using the equation:

$$G = K d^{2.5}, g.$$

**where:**

- K = 1/900 - for ball bearings
- K = 1/350 - for roller bearings
- d = bore diameter, mm

Relubrication intervals in most cases can be experimentally determined and depend on:

- bearing type
- bearing size
- operating temperature
- grease properties

Grease service life and relubricating interval can be calculated from:

$$T_{ur} = k_0 \left( \frac{14 \times 10^6}{n \sqrt{d}} - 4d \right) f_1 f_2$$

**where:**

- $T_{ur}$  = service life for relubricating interval, in operating hours
- $k_0$  = coefficient depending on the bearing type, table 5.3
- n = speed, r/min
- d = bore diameter, mm
- $f_1$  = temperature factor, table 5.4
- $f_2$  = factor depending on the operating conditions, table 5.5

**Values for coefficient  $k_0$**

Table 5.3

Bearing type	Value of $k_0$ Relubrication interval service life	Grease
Angular contact ball bearings		
Tapered roller bearings		
Thrust ball bearings	1	2
Cylindrical roller bearings	5	15
Needle roller bearings		
Deep groove ball bearings	10	20...40

**Values for factor  $f_1$**

Table 5.4

Temperature	70°C	85°C	100°C
Factor $f_1$	1	0,5	0,25

**Values for factor  $f_2$**

Table 5.5

Operating conditions	Light	Moderate	Hard	Very hard
Factor $f_2$	1	0,7...0,9	0,4...0,7	0,1...0,4

Low values are valid for deep groove ball bearings with shields, ZZ. type, or with seals, 2RS type, series 60, 62 and 63.

Bearing relubrication interval can be also determined using the chart fig. 5.1, as a function of bearing type, bore diameter and speed.

**Example:**

A bearing 6208-2RS is operated under reduced load (it is not considered for calculation), at a speed  $n = 1500$  r/min, at a temperature of +60deg C, light operating conditions. What is the grease service life and relubrication interval?

Grease service life will be:

$$T_{ur} = k_0 \left( \frac{14 \times 10^6}{n \sqrt{d}} - 4d \right) f_1 f_2 = 32\,893 \text{ hours,}$$

- $k_0 = 25$  from table 5.3
- $d = 40$  mm
- $f_1 = 1$ , from table 5.4
- $f_2 = 1$ , from table 5.5

Relubrication interval:

$$T_r = k_0 \left( \frac{14 \times 10^6}{n \sqrt{d}} - 4d \right) f_1 f_2 = 13\,157 \text{ hours,}$$

- $k_0 = 10$  from table 5.3
- $f_1 f_2 = 1$ , from table 5.4, 5.5.

**Values for coefficient K**

Table 5.6

Relubrication interval	K
weekly	0,0015...0,0020
monthly	0,0020...0,0030
yearly	0,0030...0,0045
after 2...3 years	0,0045...0,0055

From the diagram fig. 5.1, the value of the relubrication interval will be of 13 500 operating hours.

The grease quantity to be supplied can be determined using the equation:

$$G = K D B, g,$$

**where:**

- G = grease quantity, g
- K = coefficient depending on the relubrication interval, table 5.6
- D = bearing outside diameter, mm
- B = total bearing width for radial bearings, mm and total bearing height for thrust bearings, mm

Scale a; deep groove ball bearings  
 Scale b; cylindrical roller bearings  
 Scale c; spherical roller bearings, thrust ball bearings, roller thrust bearings, cylindrical roller bearings without cage.

Fig. 5.1

The chart in fig. 5.1 applies to operating temperatures which do not exceed +70°C. For operating temperatures over +70°C, see table 5.4.

Grease service life can be defined as the period of time when it preserves physical and mechanical characteristics in time and oxidizing due to temperature and vaporization of base oil doesn't occur.

A more accurate calculation of grease service life, considering grease quality and bearing operating conditions (load, size, speed, temperature etc.) can be done using the equation:

$$L = 10^a \cdot (m_1 + m_2 + m_3)$$

**where:**

L = service life, operating hours

a = exponent depending on the grease quality (a = 5,8...6,1)

m<sub>1</sub>...m<sub>3</sub> = exponents which take into account the following factors:

$$m_1 = 4,4 \times 10^{-6} D_m n,$$

$$m_2 = 2,5(P/C - 0,05),$$

$$m_3 = (0,021 - 1,80 \times 10^{-6} D_m n)t,$$

D<sub>m</sub> = bearing mean diameter, mm,

n = bearing speeds, r/min,

P = equivalent radial load, kN,

C = basic dynamic load, kN,

t = bearing operating temperature, °C

When calculating the values of t, D<sub>m</sub> n and P/C, the following have to be considered:

- when bearing operating temperature is lower than +50°C, then t = +50°C

- when speed factor D<sub>m</sub> n < 125 000, then D<sub>m</sub> n = 125 000

- when ratio P/C < 0,05, then P/C = 0,05

Grease service life, as a function of operating temperature can be approximately determined using the diagram fig. 5.2.

Fig.5.2

### Example1

A bearing 6210 operates under a load  $P_r = 5$  kN, speed  $n = 3000$  r/min at an operating temperature  $t = 50^\circ\text{C}$ . What is the service life of the grease used for bearing lubrication?

$C_r = 35,1$  kN, tables on page 132, bearing 6210

$$L = 10^{a - (m_1 + m_2 + m_3)} = 10^{6,1 - 2,273} = 6214 \text{ hours}$$

$a = 6,1$ , for Mobil grease,

$$D_m n = 65 \times 3000 = 195 \times 10^3$$

$$P_r / C_r = 5 / 35,1 = 0,143$$

$$m_1 = 4,4 \times 10^{-6} D_m n = 0,858$$

$$m_2 = 2,5 (P_r / C_r - 0,05) = 0,23$$

$$m_3 = (0,021 - 1,80 \times 10^{-8} D_m n) 65 = 1,119$$

$$m_1 + m_2 + m_3 = 2,273$$

### Example2

For the same bearing and operating conditions as in Example 1, it is required to find the service life of the same grease at a temperature of  $t = 95^\circ\text{C}$ .

$$m_3 = 1,66$$

$$m_1 + m_2 + m_3 = 2,794$$

$$L = 10^{6,1 - 2,794} = 10^{3,306} = 1774 \text{ operating hours}$$

From the diagram fig. 5.2, we can find approximately the same value, respectively 6 000 operating hours at  $+65^\circ\text{C}$  and 1700 operating hours at  $+95^\circ\text{C}$ .

Table 5.7 shows technical characteristics of typical greases, which are recommended for lubrication of sealed and shielded bearings, 2RS and ZZ types and also for rolling bearings in various assemblies and machines.

## Technical characteristics for typical greases for bearing lubrication

Base Oil	Thickener	Dropping Point	Approx Temp Range	Application	Grease Type/Producer
Mineral Oil	Polyurea	260C	-40 to +177C	Bearings for electric motors, generators, high temperature pumps, and applications requiring low noise output <ul style="list-style-type: none"> <li>• Small and medium sizes</li> <li>• Light Loads</li> <li>• High Speeds</li> </ul>	Mobil Polyrex EM
Mineral Oil	Aluminum Complex	260C	-20 to +120C	Bearings for food processing and pharmaceutical machinery, conveyor bearings, oven and freezer applications <ul style="list-style-type: none"> <li>• Heavy or shock loading</li> <li>• High speeds</li> <li>• High rust inhibition</li> </ul>	Mobil FM222
Synthetic Oil (Diester)	Lithium Soap	190C	-50 - +150C	Ball bearings <ul style="list-style-type: none"> <li>• Miniature sizes</li> <li>• Light loads</li> <li>• High speeds</li> </ul>	Kyodo Yushi Multemp SRL
Mineral Oil	Polyurea	243C	-30 to +177C	Ball and roller bearings for heavy equipment, HVAC	Chevron SRI-2
Mineral Oil	Lithium Soap	196C	-20 to +120C	Ball & roller bearings, ball bearing Inserts operating at low to high speeds	Sinopec Hangu
Mineral Oil	Lithium Soap	260C	-25 to +200C	Sealed ball bearings, ball bearing inserts running medium to high speeds in high temperature environments requiring low noise output. HVAC, high temperature motors.	Sinopec BLE
Mineral Oil	Lithium Soap	180C	-30 to +130C	Ball, roller and needle bearings for electric motors, water pumps	Shell Gadus S2 V100 (Formerly Alvania RL)
Synthetic Oil (ether based + polyolester)	Aromatic Diurea	230C	-40 to +200C	Bearings for automobile electric equipment, alternators, and electromagnetic clutches	Kyodo Yushi Multemp ET-K
Mineral Oil	Lithium Soap	180C	-30 to +120C	Heavy duty ball and roller bearings, heavy duty plain bearings operating under harsh conditions including shock loading and wet environments	Shell Gadus S2 V220 (Formerly Alvania EP), Mobilux EP2
Synthetic Hydrocarbon Oil	Synthetic (non-Soap)	232C	-54 to +177C	Spherical and cylindrical roller thrust bearings operating with high friction, plain bearings, splines, worm gears.  Low to high speeds  Excessive pressure (EP)	Mobilgrease 28

## Oil lubrication

Oil lubrication can be used in any operating condition, but this kind of lubrication is compulsory when the value of the product  $D_m n$  from table 5.2 is exceeded for grease, namely  $D_m n > 500 \times 10^3$  and when high temperatures occur in bearing. Then, oil has to lubricate and to remove heat from bearing.

Oils used for bearing lubrication can be:

- mineral oils, used up to a temperature of +150°C
- synthetic oils, used up to a temperature of +220°C

For a proper lubrication of bearings, low quantities of lubricants are needed to reach the rolling elements.

The lubricating systems must provide oil quantity necessary to prevent oil draining from bearing and heat removal in case of high speeds.

Most usual oil lubricating systems depending on factor  $D_m n$  are given in table 5.8.

### Oil lubricating systems

Table 5.8

Lubricating system	Operating conditions	Factor $D_m n$	Oil viscosity at 40°C (m <sup>2</sup> /s)	Example in fig.
Oil bath	Bath is filled up to the lowest rolling element for horizontal shaft and 70-80% of bath width for vertical shaft	$< 250 \times 10^3$	$(17...300) \times 10^{-6}$	5.3 a), b)
Oil bath with external circulation	Central tank, oil circulates under a pressure of 1,5 MPa. High speeds.	$< 600 \times 10^3$	$(45...175) \times 10^{-6}$	5.4
Oil injection	Oil is injected into the operating area under a pressure of 0.1..0.5 MPa, with flow capacity of 0.5..10 l/min depending on temperature. Heavy loads and high speeds.	$< 900 \times 10^3$	$(13,5..80) \times 10^{-6}$	5.5
Oil spot	Oil in air current under a pressure of (0.05..0.5)MPa, flow capacity of (0,5..4) m <sup>3</sup> /hour, 0,5..4) m <sup>3</sup> /hour for small and medium-sized bearings, heavy loads and high speeds.	$< 1200 \times 10^3$	$(10...45) \times 10^{-6}$	5.6

a

b

Fig. 5.3

Fig. 5.4

Fig. 5.5

Fig. 5.6

Approximate values of oil kinematic viscosity at +40°C depending on the operating temperature are given in table 5.9.

Table 5.10 shows oils which are recommended by ISO for bearing lubrication. Values of kinematic viscosity at +40°C, mm<sup>2</sup>/s are also given.

### Corelation between viscosity and temperature

Table 5.9

Temperature t °C		Viscosity at 40°C, cSt
over	up to	
–	50	12...60
50	80	37...75,5
80	120	> 75,5
120	150	227

Diagram fig. 5.7 shows kinematic viscosity classes at 40°C in accordance with ISO, its variation depending on the operating temperature (t °C) in relation to speed and bearing mean diameter ( $D_m$ ).

### Example

A bearing 6204 is to operate under a speed  $n = 2\,000$  r/min at a temperature  $t = +65^\circ\text{C}$ .  $D_m = 0,5 (d + D) = 35,5$  mm.

The viscosity of the oil for bearing lubrication is required.

From the diagram, for  $D_m = 35,5$  mm, we can find viscosity at +65°C,  $\nu_1 = 13$  cSt and viscosity at + 40°C,  $\nu = 32$  cSt.

### Recommended oils by ISO standards

Table 5.10

Class ISO	Kinematic viscosity at +40°C, mm <sup>2</sup> /s (cSt)		
	mean	low	high
ISO VG 2	2,2	1,98	2,42
ISO VG 3	3,2	2,88	3,52
ISO VG 5	4,6	4,14	5,06
ISO VG 7	6,8	6,12	7,48
ISO VG 10	10	9	11
ISO VG 15	15	13,5	16,5
ISO VG 22	22	19,8	24,2
ISO VG 32	32	28,8	35,2
ISO VG 46	46	41,4	50,6
ISO VG 68	68	61,2	74,8
ISO VG 100	100	90	110
ISO VG 150	150	135	165
ISO VG 220	220	198	242
ISO VG 320	320	288	352
ISO VG 460	460	414	506
ISO VG 680	680	612	748
ISO VG 1 000	1 000	900	1 100
ISO VG 1 500	1 500	1 350	1 650

Fig. 5.7

## Bearing designation

The purpose of designation is that of identification of bearings, so that bearings with the same designation to be interchangeable both dimensionally and operationally, no matter who the producers may be. Designations of TRITAN rolling bearings are in accordance with those used by world-known bearing companies.

The complete designation of a bearing consists of a basic design and may include one or more supplementary designations (prefixes and suffixes), as shown in chart fig.6.1. Note: designation applies to naked rolling bearings including insert bearings. Mounted bearings and plain bearings utilize a separate designation matrix.

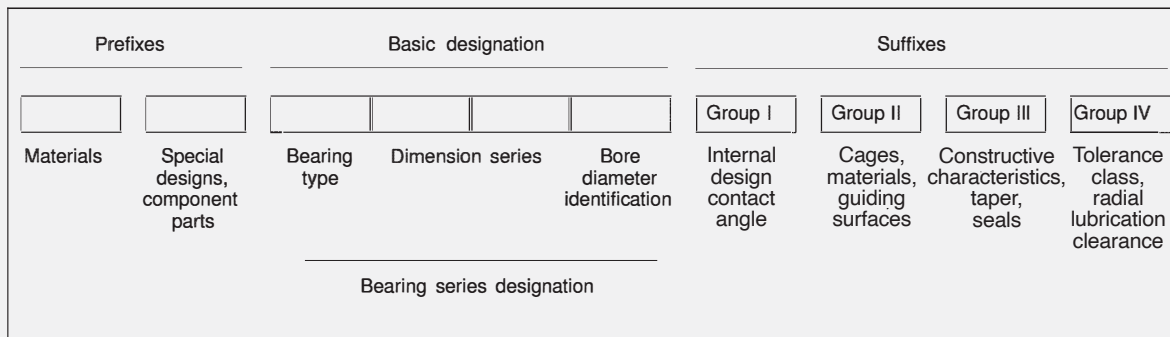

Fig. 6.1

The basic designation consists of an identification of the type of bearing (figure or letter), the series designation, in accordance with ISO and the bore diameter identification.

The designations of the bearing type and dimension series, for main standardized bearing types, are given in table 6.1.

Bore diameter identification consists of one, two or more figures as follows:

**- bore diameter from 1 to 9 mm**

- one figure, representing the bore diameter (e.g. 623, 608);

**- bore diameter from 10 to 495 mm**

- two figures, as follows: 00 for 10 mm, 01 for 12 mm, 02 for 15 mm, 03 for 17 mm, 04 and up to 99 for bore diameter from 20 to 495 mm. (bore diameter= bore diameter identification x 5, e.g. 6230, d = 150 mm);

**- bore diameter of 500 mm and over 500 mm**

- is stated directly separated by a slash, the same applies to the values which are not perfect multiples of 5, or if they include a decimal point (e.g. 619/500, 230/530).

Tapered roller bearings with inch dimensions listed in this catalog make an exception from this rule.

## Designation of the type and dimension series for the standardized bearings

Table 6.1

Bearing design	Bearing type identification	Series designation	Example	
	6	0 1 2	6208	
		4 18 19	61910	
	1 2	2 3	1205 2205	
		7	0 2 3	7005C 7210B 7305A
	3 4 5	0 2 3	3003 4205 5306	
		NU	2 52	NU208 NU5210
		NA	48 49	NA4905 NA4822
	NA	69	NA6910	
	2	13 22 23	22216 23130 24024	
		30 31 32		
		40 41		
	3	02 03 13	30205 32208 32924	
		22 23 29		
	5	11 12	51115 51212	
		13 14		
	5	22 23 24	52205 52308 52405	

## Prefixes

Prefixes are letter-identifications which indicate the material, other than steel for bearings or component parts of bearing.

## Prefixes for materials

**C** - ceramic etc. (e.g. C6205)

**SS** - stainless steel (e.g. SS6202)

## Prefixes for special designs or parts of bearings

**F** - flanged outer diameter (e.g. SSFR4, FR8 2 RS)

**CB** - ceramic balls, steel rings (e.g. CB6210)

## Suffixes

Suffixes are used to identify various constructive modifications of the bearing in comparison to normal design. They are classified in four different groups, as follows:

Group I - Modifications of internal design, design with increased basic load (e.g. A, C, E etc.), contact angle (e.g. A, B, C) and others.

Group II - Modifications of cage design, material, guiding surfaces etc. (e.g. 6205TN, NU310M).

Group III - Modifications of external design, tapered bore, groove on outer ring etc. (e.g. 1210K, 6210NR, 63102RS).

Group IV - Modifications of normal design regarding tolerance classes, bearing radial or axial clearance, stability of dimensions at high temperatures, 6206, 2RSC3, 6210TP5.

These suffixes for bearing designation are listed considering the groups they belong to, at the beginning of each bearing group.

## Mounting and dismounting

Proper operation of rolling bearings is also determined by a proper selection for the solution of mounting and dismounting, considering the type and size of bearing, fit, adequate tools for these operations, performance etc.

Rolling bearings are precision components and must be handled carefully when storing or mounting. Thus, the following conditions should be observed:

- storing in their original package, in dry room, temperature of  $+18^{\circ}\text{C} \dots +20^{\circ}\text{C}$ , maximum moisture degree of 60%
- handling bearings: storing and mounting should be carefully done so that original package is not damaged.
- bearings should be unpacked only when they are to be mounted, and need not be washed if original package hasn't been damaged.
- contact with adjacent parts must be accurate with no evidence of burrs or chips.

### Mounting of bearings with cylindrical bore

Bearings with cylindrical bore which are to have tight fit on shaft or in housing respectively, will be mounted by mechanical, thermic or hydraulic means.

The pressing force should be transmitted only by the ring which is pressed on the shaft or into the housing bore. Transmission of force on rolling elements should be avoided as they can get deformed and premature damage can occur.

Special sleeves with one or two ribs, fig.7.1, a and b are used when mounting small and medium-sized bearings, which are to be mounted with transition fit. In case of self-aligning ball bearings or spherical roller thrust bearings, a plate is mounted for a proper location of the outer ring, as shown in fig. 7.2.

Mechanical or hydraulic presses are used as shown in fig. 7.3, in case of serial production so that force can be continuously and gradually applied.

For the mounting of bearings with clearance fit into a housing or on the shaft, the ring with transition or tight fit should be mounted first, after which the shaft-bearing assembly will be mounted into the housing as shown in fig. 7.4, a and b.

Fig. 7.1

Fig. 7.2

In case of dismountable bearings, rings can be mounted separately - fig. 7.5, even if a tight fit is required for both rings.

The mounting of medium ( $d > 50 \text{ mm}$ ) and large-sized bearings with tight fit, requires much greater pressing forces. That's why in this case heating of bearings up to  $+80^{\circ}\text{C} \dots +110^{\circ}\text{C}$  should be used instead of pressing, excepting shielded bearings, ZZ type and sealed bearings, 2RS type.

To heat bearings, oil bath, electric range, thermic ring, or induction heating etc. can be used as shown in fig.7.6, a-d.

The device with thermic ring - fig.7.6 c consists of a split aluminium ring with three grips and cuts which make it be elastic.

Fig. 7.3

Fig. 7.4

Fig. 7.5

Thermic ring bore diameter is equal to inner ring raceway diameter of dismountable bearings.

The ring outside diameter can be calculated using the equation:

$$D_{ex} = \sqrt{4d_1^2 - 3d^2}, \text{ mm},$$

**where:**

$D_{ex}$  = outside diameter of the thermic ring,

$d_1$  = diameter of the inner ring raceway, mm

$d$  = bearing bore diameter, mm

The weight of the thermic ring is approximately equal to the weight of the bearing inner ring.

In case of large-sized roller bearings, heating can be done with induction devices. These devices consist of a coil inductor, thermal relays for temperature adjustment and timers. 380 V voltage and 50 - 60 Hz frequency inductors are used for bearings with bore diameter up to 200 mm. For larger-sized bearings, 20... 40 V voltage and 50 - 60 Hz inductors are used.

This device is schematically shown in fig. 7.6.d.

Fig. 7.6

Fig. 7.6 (continued)

## Mounting of bearings with tapered bore

Tapered bore bearings can be mounted directly on the shaft, on adapter sleeve or withdrawal sleeve. These bearings should always be mounted only with a tight fit. The tight fit can be done by an axial displacement of the bearing inner ring which is mounted directly on the tapered spindle of the shaft or by an axial displacement of the adapter or withdrawal sleeve.

The values of reduction in radial clearance are given in tables 7.1 and 7.2, as function of axial displacement on shaft of self-aligning ball bearings and spherical roller thrust bearings. After mounting the initial radial clearance is to be considered.

After mounting, radial clearance of radial and self-aligning ball bearings are in accordance with table 7.1.

The values of tightening are estimated by the values of the radial clearance reduction or of axial displacement. Axial displacement of the mounted bearing is measured by means of a limit gauge, as shown in fig. 7.7, a and b. The thickness of the limit gauge can be calculated from:

$$m = S - a$$

where:

m = thickness of the limit gauge, mm

Fig. 7.7

S = distance initially measured, mm

a = axial displacement, from table 7.1, mm

### Example

A bearing 22252, d = 260mm, taper 1:12, distance s=10mm, distance "a" from table 7.1 = 1,90mm, m = 10-1,9 = 8,10mm

Small-sized bearings with tapered bore which are to be mounted directly on the shaft or with adapter or withdrawal sleeves can be axially displaced by means of a nut as shown in fig. 7.8 b,c.

Medium-sized bearings can be axially displaced by means of a special nut as shown in fig. 7.9 and some screws. Then, the nut is to be dismantled and replaced with a nut for axial fastening.

Special hydraulic presses - fig. 7.10 or special hydraulic nuts - fig. 7.11 are used to mount medium and large-sized bearings.

Values for self-aligning ball bearings radial clearance, after mounting

Values in mm

Table 7.1

Bore diameter d	Reduction of radial clearance		Axial displacement "a", taper 1:12				Minimum radial clearance after mounting, in case of clearance group

Fig. 7.8

Fig. 7.9

Fig. 7.10

Fig. 7.11

Fig. 7.12

To reduce the bearing displacing force in case of large-sized bearings, pressurized oil is to be introduced between the tapered surfaces of the shaft spindle, bearing and b, by means of an oil pump - fig.7.10 or oil injector - fig. 7.12. One or more grooves should be provided as shown in fig. 7.13, a and b so that oil can be distributed between the mounting surfaces.

Fig. 7.13

## Bearing dismounting

When bearings with tapered bore are to be dismounted from the shaft or housing, the succession of operations is inversely done than in case of mounting.

Thus, the assembly mounted with clearance fit or small tightening is to be dismounted first and then the parts mounted with greater tightening, as shown in fig. 7.14 and fig. 7.15.

Fig. 7.14

Fig. 7.15

To use mechanical or hydraulic instruments, when dismounting bearings, a special design of the shaft and housing is required, as shown in fig. 7.16, a-c: withdrawal grooves (a) and (b), threaded bores (c), grooves for oil distribution, fig.7.13.

Fig. 7.16

Medium and small-sized bearings which are mounted with a tight fit are dismounted from the shaft by means of a soft steel or copper mandrel or by means of mechanical or hydraulic presses - fig.7. 17, a-c.

Fig. 7.17

To reduce the frictional force when dismounting large sized bearings which were mounted on shaft with tight fit, pressurized oil should be introduced, as in case of mounting - fig.7.11.

To dismount bearings with tapered bore, which were mounted directly on the shaft, or bearings which were mounted with withdrawal or adapter sleeves, the axially fastened nut should be first stripped. Then, dismantling is to be done by light hammering on the inner ring by means of a soft steel or copper mandrel, as shown in fig. 7.18, a and b.

In case of bearings mounted with withdrawal sleeves, a nut is to be screwed up on the threaded part provided for this purpose, as shown in fig. 7.19, a and b.

In case of large-sized bearings, hydraulic devices are used as in case of mounting.

Fig. 7.18

Some solutions for dismounting bearings with tapered bore mounted directly on the shaft spindle, with adapter or withdrawal sleeve are given in fig. 7.20, a and b.

Fig. 11.20

# TRITAN

**PRECISION BEARINGS AND POWER TRANSMISSION COMPONENTS**

Deep Groove  
Ball Bearings

Deep groove ball bearings are manufactured in a varied range, both of standard design and various constructive versions.

These are used in a wide array of applications. Single row deep groove ball bearings are manufactured in many configurations as shown below.

**Z**

**ZZ**

**ZR**

**RS**

**2RS**

**2RSL**

**K**

**N**

**NR**

## Suffixes

- C2** - radial clearance smaller than normal (tight)
- C3** - radial clearance larger than normal
- C4** - radial clearance larger than C3 (loose)
- EE** - bearing with extended inner ring
- F** - machined cage of steel or cast iron guided in the outer ring
- K** - bearing with tapered bore
- M** - machined cage of brass guided on the rolling elements
- N** - circular groove for snap ring on the outer ring
- NR** - circular groove on the outer ring and snap ring
- PO** (ABEC 1) - normal tolerance class (it is not marked)
- P6** (ABEC 3) - tolerance class more accurate than normal
- P63** - tolerance class P6 and radial clearance C3
- P5** (ABEC 5) - tolerance class more accurate than P6

- P4** (ABEC 7) - tolerance class more accurate than P5
- RS** - bearing with seal on one side, with friction on the inner ring recess
- 2RS** - bearing with 2 seals, friction on the inner ring recess
- RSR** - bearing with seal on one side, friction on the rib of the inner ring
- 2RSL** - bearing with 2 seals, light contact on inner ring groove
- TN** - polyamide cage
- V** - bearing without cage
- Z** - bearing with shield and recess on the inner ring
- ZZ** - bearing with 2 shields and recess on the inner ring
- ZR** - bearing with shield and recess on inner ring

# Deep Groove Ball Bearings

## Sealed and shielded deep groove ball bearings

In case of bearings with non-rubbing shields, there is a small interstice between the shield and the rib of the inner ring; in case of bearings with seals, the oil resistant elastic rubber lip rubs on the groove on the inner ring side (2RSL) or directly on the outside surface (2RS).

Bearings sealed and shielded on both sides are delivered filled with high speed, noise dampening polyurea thickened grease and are used at temperatures between -40°F and +350°F . Bearings can also be greased with special greases, relubrication not being necessary. Washing or heating are not allowed before bearing mounting in the assembly.

Bearings with shields have been designed primarily for cases when the inner ring rotates. When the outer ring rotates, the lubricant can flow out of the bearing at a certain speed. In such cases, we recommend you consult our engineers.

## Deep groove ball bearings with snap ring groove

Deep groove ball bearings, with snap ring groove on the outer ring can be located in the housing with snap rings.

Because of their simple and space saving mounting, these bearings simplify the assembly design. The groove for the snap ring and the snap rings are in accordance with ISO 464.

## Stainless steel deep groove ball bearings

Deep groove ball bearings can be made of stainless steel, providing high resistance to corrosion, high stability, high

temperature and high resistance to chemicals. Inner rings, outer rings and balls are constructed of AISI 440C Martensitic stainless steel. The retainer, seals and shield utilize AISI 301 stainless providing the ultimate corrosion resistance in humid and caustic environments.

Stainless steel deep groove ball bearings are lubricated with a multipurpose FDA approved grease and are suitable for a wide variety of standard and specialized applications.

## Dimensions

The overall dimensions of deep groove ball bearings are in accordance with the stipulations of ISO and ABMA (formerly AFBMA).

## Misalignments

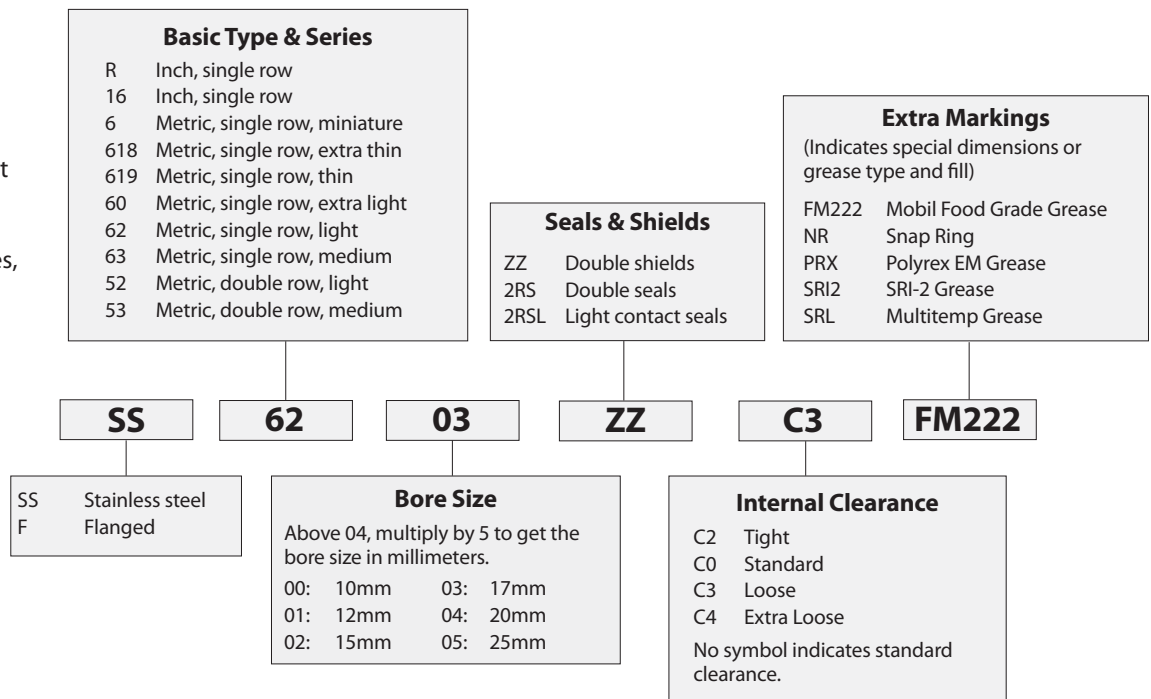

Deep groove ball bearings have limited abilities to compensate for bearing errors of alignment. The permissible misalignment between the outer ring and the inner ring, which will not produce inadmissible high additional loads in the bearing, depends on the bearing size, operational radial clearance, inner bearing design and also on the magnitude of loads and moments acting upon the bearing. Because of the complex relationship of these influence factors, definite and universally valid values of permissible misalignment cannot be determined .

Considering the above mentioned factors, under normal operation conditions the permissible misalignments are between 2 and 10 minutes of arc, depending on the bearing series and load.

It should be considered that misalignments of bearing rings in operation produce a considerably higher noise.

## Part Number Nomenclature

Each TRITAN Deep Groove Ball Bearing part number is a unique combination indicating the bearing's type, series, internal clearance, bore size, seal and shields.

## Tolerances

Deep groove ball bearings are generally manufactured to the normal tolerance class P0 (ABEC 1), however modern machinery often outputs bearings that comply with P6 (ABEC 3).

At request, they can also be manufactured to the tolerance classes P6, P5 or P4.

## Radial and axial clearance

TRITAN deep groove ball bearings are generally manufactured with a C3 radial clearance. At request, they can also be manufactured with radial clearance tighter or looser than C3 according to ISO 5753. The values of radial clearance are given in table 1.

**Radial clearance of deep groove ball bearings**

## Cages

Deep groove ball bearings are generally fitted with cages of pressed steel sheet.

Cages of glass fiber-reinforced polyamide 6.6 are also suitable if the operating temperature doesn't exceed +120°C. They have reduced weight, low coefficient of friction and are noiseless in operation. Large-sized bearings are fitted with machined brass cages. Cage design and some technical data are given in table 3.

## Bearing minimum radial load

A minimum load must be applied on a deep groove ball bearing so that they can operate correctly, especially in case of operating under heavy loads.

# Deep Groove Ball Bearings

**Cage design and technical data**

**Table 3**

Cage	Design bearing	cage	Application	Max. value $D_m n$	
				oil	grease
Pressed sheet cage with fins			<ul style="list-style-type: none"> <li>- General application</li> <li>- Bearings with <math>d &lt; 10</math> mm</li> <li>- Low frictional moment</li> <li>- Low inertia</li> <li>- Moderate speeds.</li> </ul>	$550 \times 10^3$	$450 \times 10^3$
Pressed cage of riveted sheet			<ul style="list-style-type: none"> <li>- General application</li> <li>- Bearings with <math>d &gt; 10</math> mm</li> <li>- Low frictional moment</li> <li>- Low inertia</li> <li>- Moderate speeds.</li> </ul>	$1000 \times 10^3$	$550 \times 10^3$
Polyamide cage			<ul style="list-style-type: none"> <li>- General application</li> <li>- Low frictional moment</li> <li>- High speeds</li> </ul>	$1400 \times 10^3$	$1100 \times 10^3$
Brass machined cage			<ul style="list-style-type: none"> <li>- General application</li> <li>- Small bore bearings subjected to vibration conditions.</li> <li>- Large bore (150mm+) bearings</li> </ul>	$1000 \times 10^3$	$800 \times 10^3$

The forces of inertia which occur in bearing as well as the friction in lubricant influence negatively the operating conditions and can cause detrimental sliding movements between balls and raceways.

Minimum radial load depends on the bearing size, speed and lubricant viscosity at operating temperature. It can be roughly calculated from the equation:

$$F_{r \min} = 0,01 C_r \cdot (C_r = \text{basic dynamic radial load}).$$

## Equivalent dynamic radial load

Deep groove ball bearings can take also radial and axial combined loads.

For deep groove ball bearings, single or paired in tandem arrangement DT, equivalent dynamic radial load can be calculated using the equation:

$$P_r = F_r, \text{ kN,} \quad \text{when } F_a/F_r \leq e$$

$$P_r = X F_r + Y F_a, \text{ kN,} \quad \text{when } F_a/F_r > e$$

The greater the axial load, the greater the contact angle of these bearings.

Factors  $e$ ,  $X$  and  $Y$  depend on the ratio  $f_0 F_a / C_{0r}$ . Factor  $f_0$  can be

determined using the diagram in the figure at right, as a function of dimension series and mean diameter  $(d + D)/2$ .  $F_a$  is the axial load and  $C_{0r}$  is the static basic load of the bearing.

The values of factors  $e$ ,  $X$ ,  $Y$  which depend on the bearing clearance can be determined from table 4, corresponding to the values of the ratio  $f_0 F_a / C_{0r}$ . The values in table 4 apply to bearings mounted with normal fit, i.e. shafts manufactured to tolerance class j5 or k5 and housing J6, respectively.

Calculation factors e, X and Y for deep groove ball bearings, single mounted or matched in tandem. **Table 4**

$f_0 F_a / C_{0r}$	Normal radial clearance			Radial clearance C3			Radial clearance C4		
	e	X	Y	e	X	Y	e	X	Y
0,2	0,19	0,56	2,25	0,32	0,46	1,77	0,38	0,44	1,44
0,4	0,22	0,56	1,95	0,34	0,46	1,63	0,42	0,44	1,36
0,8	0,26	0,56	1,68	0,38	0,46	1,44	0,45	0,44	1,25
1,6	0,31	0,56	1,40	0,43	0,46	1,27	0,48	0,44	1,16
3	0,37	0,56	1,20	0,48	0,46	1,14	0,52	0,44	1,08
6	0,44	0,56	1,02	0,54	0,46	1	0,56	0,44	1

The shoulder should have the proper height corresponding to maximum bearing mounting chamfer.

The values of the connection radius ( $r_u$ ) and support shoulder height ( $h_u$ ) as functions of mounting chamfers are given in table 6.

## Axial load

If deep groove ball bearings are purely axial loaded, the axial load should not exceed  $0,5 C_{0r}$ . In case of small-sized bearings and bearings of light series (diameter series 8, 9, 0 and 1), the axial load should not exceed  $0,25 C_{0r}$ .

Heavy axial loads cause a significant decrease of bearing rating life. In such cases, we recommend you to consult our experts.

## Abutment dimensions

For a proper location of bearing rings on the shaft shoulder and housing shoulder, respectively, maximum shaft (housing) connection radius  $r_u$  max should be less than minimum bearing mounting chamfer  $r_s$  min.

**Abutment dimensions**

**Table 6**

## Table of Contents

### Single Row Radial Deep Groove Ball Bearings ..... Page 52

These are the most common and versatile bearings. Produced with metric dimensions, their simple non-separable design allows for use a wide variety of applications requiring little maintenance. The available sizes are sorted and listed by the bore dimensions and include dimensional and performance data for various common configurations including: Open, Double Sealed (2RS), Double Shielded (ZZ), and with Snap Ring (NR). Other configurations are also available. The following series of Single Row Deep Groove Ball Bearings are included:

61700 Series - Ext-Light-Narrow Series	6200 Series - Standard Duty
61800 Series - Light-Narrow Series	6300 Series - Medium Series
61900 Series - Narrow Series	6400 Series - Heavy Series
600 Series - Light Series	

### Stainless Steel Single Row Radial Deep Groove Ball Bearings ..... Page 65

These bearings share the same basic dimensional properties as standard Deep Groove Ball Bearings, but are produced of Stainless Steel providing a high-level of corrosion resistance for applications operating in demanding and/or corrosive environments. Most sizes are pre-lubricated with a multipurpose FDA approved grease to meet regulatory requirements in applications such as food and pharma.

### Inch Series Single Row Deep Groove Ball Bearings ..... Page 67

Standard Deep Groove Ball Bearings but produced with Inch dimensions:

R ZZ/2RS, 1600 ZZ/2RS, SS1600 2RS

### Miniature Single Row Deep Groove Ball Bearings ..... Page 70

Standard Deep Groove Ball Bearings produced with bore sizes from 1/8" (inch series), 3mm (metric)

600 ZZ/2RS, SS600 ZZ/2RS, L..ZZ, LF..ZZ, SSLF..ZZ SSR, SFR ZZ, SFR ZZEE, SSRI..ZZ, SSRIF ZZ, SSRIF ZZEE

### Cartridge Type Single Row Radial Ball Bearings ..... Page 76

Single Row ball bearings that follow the basic 6200/6300 dimensions except with special wider width to allow extra grease:

W200PP, W300PP

### Single Row Angular Contact Ball Bearings ..... Page 78

Designed to accommodate thrust or combination thrust and radial loads:

7200/7300B, 7200/7300BG, 7200/7300BMG

### Double Row Angular Contact Ball Bearings ..... Page 80

Designed to accommodate heavy radial loads, combined radial and thrust loads and 2 directional loads:

3000 2RS, 5200/5300 2RS, 5200/5300 ZZ, W5200 2RS

### Self-Aligning Ball Bearings ..... Page 82

Designed for light duty applications where misalignment may occur: 1200, 2200 2RS

### Thrust Ball Bearings ..... Page 83

3 Piece and banded configurations designed to accommodate light to moderate thrust loads at low to medium speeds:

W, EW, XW, B, D, GT, 900, 2900, 3900 Series

TRITAN Stainless Steel Deep Groove Ball Bearings are produced with AISI 440C Stainless steel to resist corrosion and provide exceptional hardness and strength life. They feature 304 Stainless Steel cages and are produced with full contact Rubber Seals (2RS) or low friction stainless shields (ZZ) both to retain lubricant and protect the bearing from contaminants; or in an open configuration. Sealed and shielded bearings are lubricated for life with a high quality food grade (FM222) grease.

Stainless Steel Deep Groove Ball Bearings are widely used in a variety of applications where the bearing is subjected to corrosive environments or frequent wash-downs including: pharmaceutical, food equipment, poultry, and chemical.

R Series bearings are single-row radial bearings that are available in inch sizes for shafts from 1/8" to 1 1/2".

They are produced open, shielded, and sealed. The shielded and sealed configurations are lubricated for life with a high quality Polyrex EM grease.

Most sizes are also available in stainless steel lubricated with food grade grease (refer to page 37).

1600 Series bearings are single-row radial bearings that are available in inch sizes for shafts from 1/4" to 1 1/2".

The series was originally produced as semi-ground, but is now supplied as a fully ground precision. The series is produced either shielded or sealed and lubricated for life with a high quality Polyrex EM grease.

Cartridge-Type bearings are single row radial ball bearings that follow the basic 6200/6300 series dimensions except with special wider (domestic inch dimension) width. This width creates an extra large grease chamber that is packed with high quality grease. The bearings feature full contact rubber seals (2RS) to retain the grease and protect the bearing from contaminants. This design is appropriate for applications that demand or benefit from a larger grease supply inside the bearing.

## Single Row Angular Contact Ball Bearings

Single Row Angular Contact Ball Bearings are used in applications that call for thrust or combination thrust and radial loads. Standard production is made with a 40° contact angle (B Suffix) but can also be produced with a 25° contact angle (A Suffix) or a 15° angle (C suffix). Retainers are constructed of steel (B/BG) or brass (B/BMG). Non-Metallic cages can be made upon request.

## Double Row Angular Contact Ball Bearings

Double row angular contact ball bearings are used in instances of heavy radial loads, combined radial and thrust loads, and two directional loads. They correspond in design to 2 single row angular contact ball bearings but take up less axial space. They provide stiff bearing arrangements and are able to accommodate tilting moments.

## Self-Aligning Ball Bearings

Self-Aligning Ball Bearings have two rows of balls and are constructed with the inner ring and ball assembly contained within an outer ring which has a spherical raceway for self-aligning. Very loose conformity between balls and outer ring keeps friction and frictional heat at low levels and results in excellent high-speed performance. The reduced friction can also reduce noise and vibration levels, and lead to extended bearing life and maintenance intervals. They are particularly suitable for light duty applications where misalignment occurs from errors in mounting and/or from shaft deflection.<sup>1</sup>

The 2200 Series is supplied pre-lubricated with high quality PolyRex EM polyurea based grease, and equipped with seals to prevent dust and dirt from entering the raceways. These are appropriate for applications where the bearings exposed to dirty environments.

<sup>1</sup>For applications where higher bearing load carrying capacity is required (particularly axial load), spherical roller bearings, which have the same self-aligning property, should be used.

# Thrust Ball Bearings

## W Series Thrust Ball Bearings

- Medium cross section
- Grooved races
- Single direction
- Separable axial contact
- Rings and balls constructed of thru-hardened 52100 steel

## EW Series Thrust Ball Bearings

- Light cross section
- Flat races
- Single direction
- Rings and balls constructed of thru-hardened 52100 steel
- Retainer is bronze (M) or plastic (TN) for bore diameters of 1/2" and smaller

# Thrust Ball Bearings

## XW Series Thrust Ball Bearings

- Light cross section
- Grooved races
- Single direction
- Rings and balls constructed of thru-hardened 52100 steel
- Retainer is machined bronze

## B Series Thrust Ball Bearings

- Banded assembly - non-separable
- Single direction - flat seat design
- Grooved races
- Inch dimensions
- Rings and balls are constructed of thru-hardened 52100 steel
- Band is constructed of high quality low carbon steel
- Bearings are supplied with light oil lubrication

## GT Series Thrust Ball Bearings

- Inch dimensions
- Grooved races
- Single acting
- Flat seat
- Rings and balls are constructed of thru-hardened 52100 steel
- Retainer is pressed steel
- Speed limit shown is for oil lubrication

# TRITAN

**PRECISION BEARINGS AND POWER TRANSMISSION COMPONENTS**

Roller Bearings

Spherical Roller bearings utilize 2 rows of rollers operating in a common sphered outer ring raceway. This design provides a self-aligning solution that is the combination of a radial & thrust bearing that operates even if the shaft and housing are, or become, misaligned under load.

This high capacity bearing performs consistently in adverse conditions such as shock loads, shaft deflections, marginal lubrication, extreme speeds, contamination, and critical application stresses.

TRITAN Spherical Roller Bearings are constructed with a brass one piece CAM cage. As compared to the older style MB cage, this design allows for a longer roller and higher overall load carrying capacity, providing better performance & greater life.

*Certain special applications with higher degrees of axial load may perform better with the MB cage. MB and CC style (Steel) cages are available upon request & lead time. Minimums may apply.*

TRITAN Spherical Roller Bearings are produced with a cylindrical bore, as well as a tapered bore in most sizes. Tapered bore bearings will carry the "K" suffix (CAKM), and can be mounted on a smooth or stepped shaft using an adapter or a withdrawal sleeve. This arrangement facilitates easy mounting & dismounting.

To facilitate efficient lubrication, the bearings are equipped with an annular groove and lubrication holes in the outer ring. This is represented by the W33 suffix.

Due to superior design capabilities, Spherical Roller Bearings are used in a wide variety of applications including:

- wind power
- mining
- pulp & paper
- power generation
- shipping & cargo operations
- oil field
- aggregate
- gear drives
- rolling mills

# Spherical Roller Bearings

## 21300 Narrow Series

- 1 piece CAM brass cage
- W33 oil hole & groove in OD
- Available with a tapered bore for adapter style mounting - suffix "K"

Tapered Bore configurations (K suffix), special trash-guard, and high temperature seal configurations are also available subject to production lead times and minimum quantities

# Cylindrical Roller Bearings

## Single Row

Single Row Cylindrical Roller bearings in the NU configuration are designed to allow heavy radial loads at high speeds. They consist of cylindrical shaped rollers that are guided between integral open flanges on the outer ring, and retained by a brass cage. This design allows the inner ring to move relative to the outer ring, allowing for axial displacement which is critical to performance in many heavy duty applications.

Bearing Designation	Ref #	Dimensions			Load Ratings (Lbs)		Limiting Speeds (r/min)		Weight (Lbs)

## Cylindrical Roller Thrust Bearings - T Series

The T Series bearing is the most popular cylindrical roller thrust bearing. It is single acting (one direction) and designed to operate under heavy loads at moderate speeds. One of the thrust plates is stationary with respect to the shaft while undersized on the outer diameter, while the second thrust plate is stationary with the housing, and oversized on the bore diameter. The roller assembly is located by the shaft and its inside diameter is machined to provide the correct operating clearance. The non-locating diameters of the thrust plates are designed to allow lubricant flow. Machined Brass retainers are standard.

## Drawn Cup Needle Bearings - B Series - Full Complement

Drawn Cup needle bearings are designed to support radial loads and reduce friction between rotating components with a drawn outer shell acting as a raceway for the rollers. The inward turned lips of the cup are used to mechanically retain a full complement of rollers. The low cross section of the drawn cup, provides the maximum load carrying within the smallest amount of space.

This full complement design (no cage) permits a high radial load carrying capacity. Bearings with the OH suffix include an oil hole in the outer diameter for relubrication. These bearings are easily installed with a press fit in the housing.

## Drawn Cup Needle Bearing - J Series - Caged

This caged design of Drawn Cup Needle bearing allows for high speed operation and maximum lubricant retention capability. Bearings with the OH suffix include an oil hole in the outer diameter for re-lubrication. Bearings with a T or TT in the prefix (example JTT1012) are constructed with 1 or 2 seals to retain lubricant & prevent contaminants from reaching the raceways. These bearings are easily installed with a press fit in the housing.

## Needle Roller Thrust Bearings - NTA Series

Needle Roller Thrust Bearings roller assemblies (NTA Series) utilize small diameter needle rollers configured in a spoke-like pattern, equally spaced by a cage that keeps the rollers separated and tracking in an orbital path. They are most commonly used sandwiched between thrust washers (TRA, TRB, TRC, TRD Series). These assemblies transmit a thrust load between two relatively rotating objects while greatly reducing friction.

The roller assemblies (NTA Series) are sold separately from the washers (TRA...etc). The washers are available in various thicknesses, starting with TRA as the thinnest, increasing in thickness with the TRB, TRC, and TRD options.

Thrust Washer

## Needle Roller Bearings - MR Series

MR Series Needle Roller Bearings have a one piece channel-shaped outer ring providing maximum load capacity. Integral flanges provide axial location for the needle rollers while a steel cage provides inward retention. Available either open or with 2 contact lip seals, they are supplied with a lubrication groove and hole in the outer ring to facilitate lubrication.

They can be run on a shaft or used with MI Series Inner Ring.

## Needle Roller Bearings - MI Series

MI Series Inner Rings are designed to be used with MR Series Heavy Duty Needle Roller Bearings when it is not practical to use the shaft as the inner raceway. They are designed with a groove and oil hole to facilitate lubrication.

## Drawn Cup Roller Clutch Bearings

Drawn Cup Needle Roller Clutches are similar to Drawn Cup Needle Roller Bearings in design, however they allow rotation in only one direction while transmitting torque in the opposite direction. Like the basic drawn cup needle roller bearings, they provide a low cross section that allows it to be used in the smallest amount of space. They are designed to operate directly on a hardened shaft.

The design calls for caged construction that includes an interior spring that wedges against the needle rollers and allows free running in one direction but locks the clutch with the shaft when rotated in the opposite direction. The bearings are easily installed with a press fit in the housing.

# Cam Followers

## CF-SB Series

Cam Followers (also known as track rollers) are designed with a thick outer ring to run directly in a track. The design permits high-load carrying capacity while minimizing distortion/bending. Stud type Cam Followers utilize needle rollers in a full complement configuration (no cage) to maximize load capacity and are designed for overhung or cantilever mounting. They are supplied fully lubricated with a high quality multipurpose grease, but are also relubricatable through a radial hole in the stem of the stud or through either end of the stud.

Seals (suffix S) utilizing internal thrust washers extend service life in dusty environments or in conditions of infrequent re-lubrication.

TRITAN Cam Followers are supplied with a black oxide finish to prevent corrosion, and hexagonal wrench socket (suffix B) in the end of the stud that facilitates easy mounting, especially in situations in blind holes or when greater than average thread torque is required.

Cam Followers are commonly used in industrial applications such as material handling equipment, ram support rollers, and indexing equipment.

# Yoke Roller

## CYR-S Series

- Full complement
- Sealed
- Black oxide finish

Yoke Type Cam Followers (also known as track rollers or yoke rollers) are designed with a thick outer ring to run directly in a track. The design permits high-load carrying capacity while minimizing distortion / bending. They utilize needle rollers in a full complement configuration (no cage) to maximize load capacity, are designed for shaft mounting, and are supplied fully lubricated with a high quality multipurpose grease; but are also relubricatable through a radial oil hole found in the inner race.

Seals (suffix S) utilizing internal thrust washers extend service life in dusty environments or in conditions of infrequent re-lubrication. TRITAN Cam Followers are supplied with a black oxide finish to prevent corrosion.

Yoke Rollers are commonly used in industrial applications such as: material handling equipment, ram support rollers, and indexing equipment.

## Metric Tapered Roller Bearings

Taper roller bearings utilize cone shaped rollers in an inner ring which rolls on tapered outer ring surfaces. The rollers are guided by a cage, and the projection lines of the tapered surfaces meet at a common point on the bearing axis. Their design makes them suitable for combined (radial & axial) loads, and heavy axial loads determined by the contact angle.

Standard designs are typically separable and most commonly designed with a cone (inner ring with cage and rollers), which can be mounted separately from the cup (outer ring). This design allows for great flexibility in assembly, and is one of the key advantages to this type of bearing. Unlike the common inch series taper roller bearings, Metric Tapered Roller Bearings are sold exclusively as a complete cup and cone set.

Bearing Designation	Dimensions					Load Ratings (Lbs)		Limiting Speeds (r/min)		Weight (Lbs)

# TRITAN

**PRECISION BEARINGS AND POWER TRANSMISSION COMPONENTS**

Mounted Ball  
Bearing Units

## Applications

TRITAN offers a large assortment of mounted ball bearing units, in numerous configurations making them suitable for a wide variety of common and specialized applications.

Standard units feature cast iron housings and ball bearing inserts with sphered outer rings that self-align within the housing to compensate for misalignments. This makes the units highly versatile providing peak performance even in challenging applications. With many options available, units can be configured with various materials, mounting and shaft locking solutions & sealing and lubrication selections to provide optimal function and a long running life.

Ball Bearing Mounted Units units are commonly used in industrial and commercial applications including industrial machinery, conveyors, fans/blowers, agricultural equipment, construction machinery, exercise equipment, and food processing equipment, among many others.

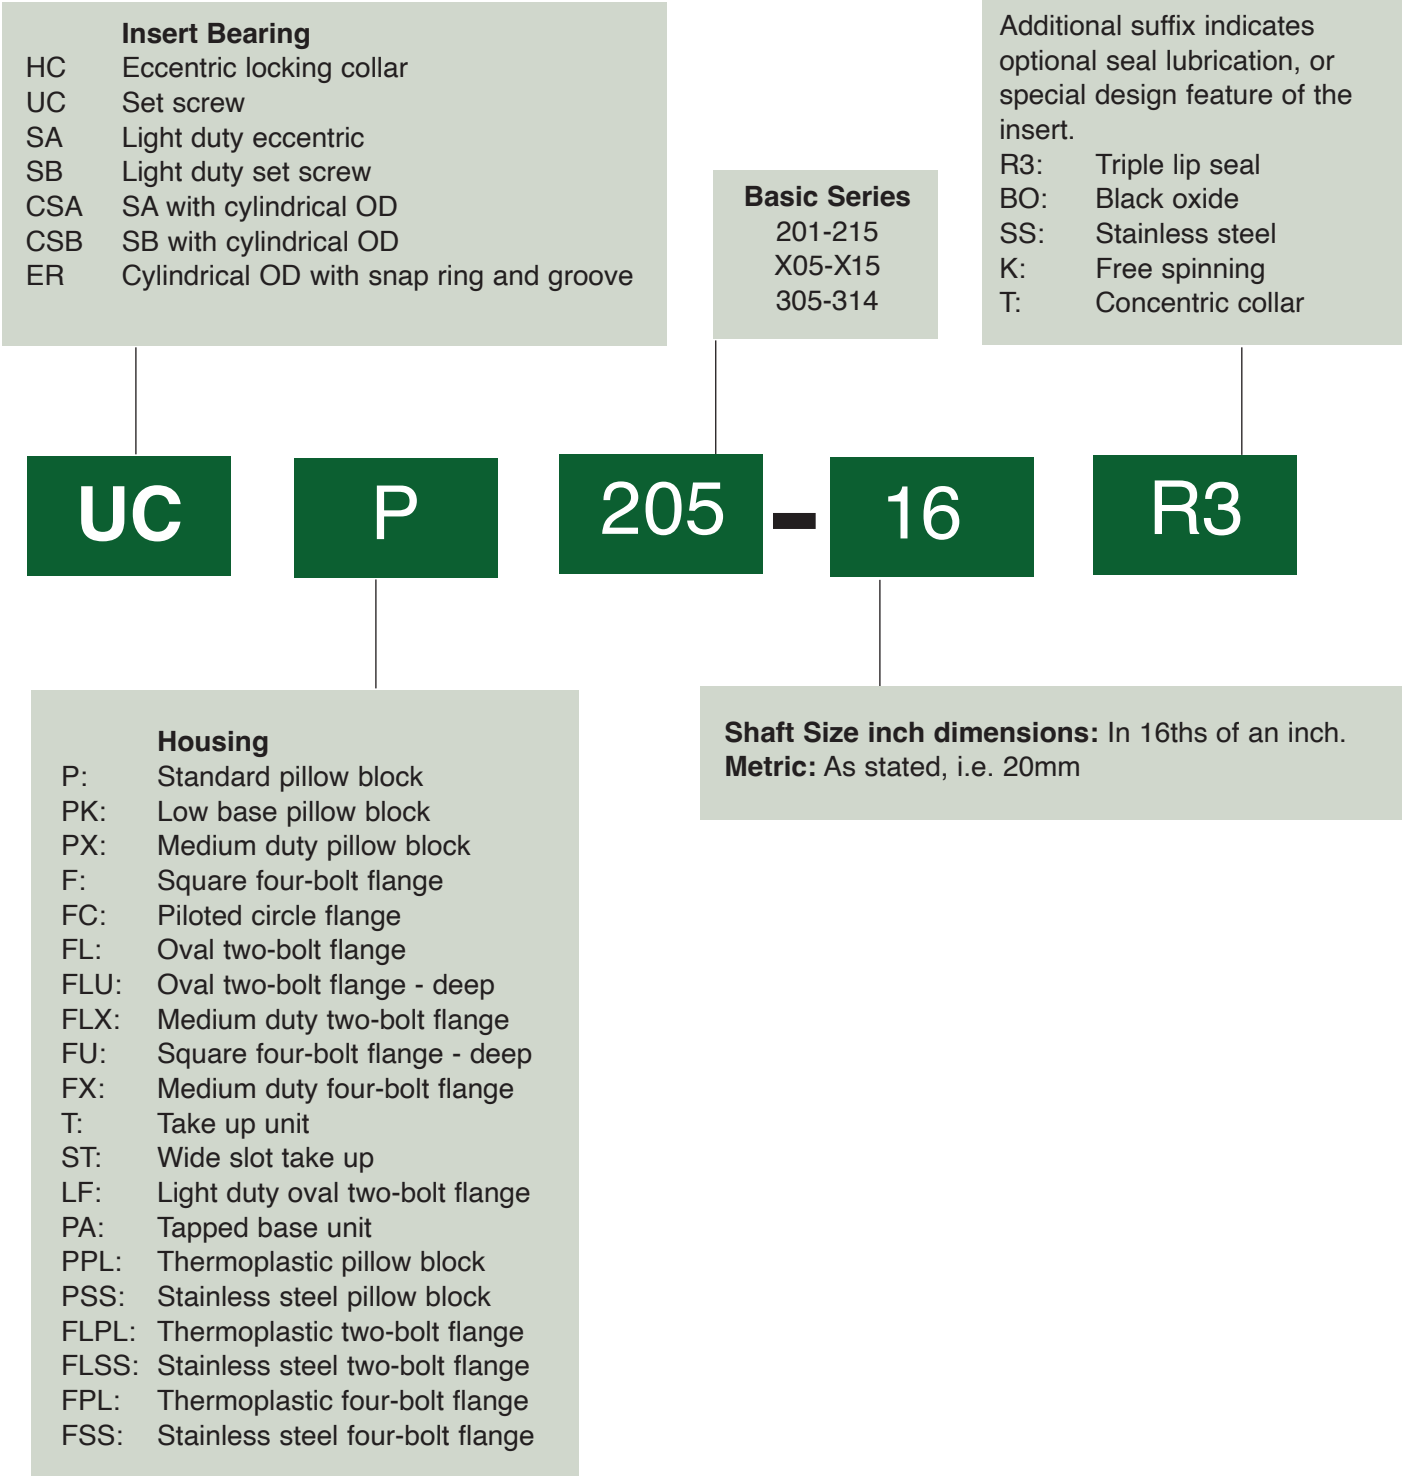

# Mounted Ball Bearing Units

## Part Number Nomenclature

Each TRITAN Mounted Ball Bearing part number is a unique combination indicating the bearing's type, series, housing and shaft size.

# Mounted Ball Bearing Units

## Construction & Features of Ball Bearing Mounted Units

TRITAN's mounted bearing units are compact in design with sealing devices that ensure long-lasting performance. Standard bearing inserts have spherical ODs, enabling them to self-align in outer housings. Cylindrical OD inserts are also available. Standard housings are constructed of high-quality grey iron. All TRITAN ball bearing units have heavy-duty contact-type seals with a protective metal shroud or slinger on both sides. Long bearing life can be achieved by selecting the type of seal best for the application and operating condition. Standard units have dual seals. Triple lip seals are available as an option.

### Housings

TRITAN ball bearing mounted units are most commonly constructed of high-quality grey cast iron, however to address the demands of a wide variety of applications, there are a few options.

- **Cast Iron:** One-piece cast-iron housings provide solid construction and maximum wear resistance.
- **Ductile Iron:** One piece ductile or malleable iron housings are made to the same exacting standards as cast-iron housings but provide higher tensile strength.
- **Stamped Steel:** TRITAN offers a wide variety of zinc plated stamped steel pillow block and flanges housings of various thicknesses for light load applications.
- **Nickel Plated Housings:** For applications in the food, chemical and where added corrosion protection is needed

- **Thermoplastic Housings:** TRITAN Thermoplastic polymer housings are made of FDA recognized material and incorporate solid bases and stainless-steel bolt inserts and grease fittings. When combined with stainless steel or black oxide insert bearings, they provide excellent resistance to corrosive elements and are especially suited for use in wash down applications.
- **Stainless Steel:** TRITAN stainless steel housings are made of series 304 stainless steel and incorporate series 300 stainless steel grease fittings. Solid mounting surfaces make them ideally suited for food and chemical applications.
- **Rubber Insulators:** Nitrile rubber insulators provide insulation and noise reduction properties. The conductive rubber interliners are available for use with most styles of stamped steel housings.

Shaft Size	Grease Fitting Thread
Up to 1-7/16 in	1/4 - 28 UNF
1 -1/2 in & over	1/8 - 27 NPT

# Mounted Ball Bearing Units

## Grease Fitting

- All units can be re-lubricated through the grease fitting provided. The outer housing grease hole mates up with the bearing insert groove, which channels grease into the bearing. Refer to appendix for grease fitting options and dimensions.

## Grease

- Bearings are supplied 35-40% filled with lithium based NLGI #2 grease and should be relubricated with a compatible grease. Refer to appendix for suggested greasing intervals.

## Temperature Limits

Units are designed to operate at full rating at temperatures of  $-40^{\circ}\text{F}$  to  $250^{\circ}\text{F}$ . Special lubricants should be considered for temperatures beyond this range. Refer to appendix for grease properties and other available greases.

## Seals

- Dual Seals (B-Type) are standard on wide inner ring bearings. A synthetic rubber oil seal is fixed to the outer ring diameter groove and seals against the inner ring, while a steel slinger is fixed to the inner ring and rotates with the shaft. The simultaneous revolution with the inner creates a positive pressure, that together with the labyrinth design provides excellent protection from dust and contamination in most conditions.
- Dual Seals (K-Type) are standard on narrow inner ring bearings. Synthetic rubber is baked on to a plate steel shroud, that is fixed to the outer ring. The rubber provides tight positive contact with the inner ring keeping contaminants out of the bearings, while the steel shroud protects rubber seal; providing excellent service life in semi-harsh conditions.
- Triple Lip Seals are available to protect against contamination in severe environments. They consist of a synthetic rubber seal protected with a steel shield fixed in the outer ring with three separate sealing lips wiping the inner ring OD. They are specified by adding the suffix "R3" to the model number.

## Self Alignment

The outer rings of insert bearings are spherically ground to correspond with a matching spherical bearing seat on housings. This spherical combination provides self-alignment features, which compensate for alignment errors, uneven mounting surfaces and shaft flexing.

Misalignment of  $\pm 2^{\circ}$  for bearings size 211 and smaller, and  $\pm 1.5^{\circ}$  for larger sizes for re-lube units is possible. Misalignment greater than this will prevent the lubrication holes in the outer ring of the bearing from lining up with the groove in the housing bore, and the bearings will not be re-lubricated. For non-re-lube units, misalignment of up to 5 degrees is allowable.

## Anti-Rotation Device

The use of an anti-rotation pin in the outer ring prevents the bearing outer ring from turning in the housing. Located in the housing loading slot, this feature does not interfere with the self-aligning capability of the assembly. The anti-rotation pin is standard on wide inner ring bearings and an available option on flush back inner ring bearings.

## Packaging

Mounted units and inserts are sealed in plastic bags and packed in sturdy individual boxes. Units and inserts may also be available in bulk packaging.

## UCP..T Standard Duty Premere-LOC (Concentric Collar Locking)

Premere-LOC mounted units provide quieter, smoother and more efficient operation, especially under higher radial loads. The concentric locking collar provides a uniform grip to the inner ring leading to an operational true centerline, reducing vibration at higher speeds. As well, the concentric locking force significantly reduces the chance of damaging the shaft.

These one-step easy installation units are ideal for bi-directional applications and can replace both set screw locking and eccentric collar locking bearings.

- Cast iron housing - solid base
- Wide inner ring bearing
- Dual seals (Type B)

# Mounted Ball Bearing Units

## Flanges

### UCF..T Standard Duty Premere-LOC (Concentric Collar Locking)

Premere-LOC mounted units provide quieter, smoother and more efficient operation, especially under higher radial loads. The concentric locking collar provides a uniform grip to the inner ring leading to an operational true centerline, reducing vibration at higher speeds. As well, the concentric locking force significantly reduces the chance of damaging the shaft.

These one-step easy installation units are ideal for bi-directional applications and can replace both set screw locking and eccentric collar locking bearings.

- Cast iron housing
- Wid inner ring bearing
- Dual seals (Type B)

# Mounted Ball Bearing Units

## Flanges

### UCFL..T Standard Duty Premere-LOC (Concentric Collar Locking)

Premere-LOC mounted units provide quieter, smoother and more efficient operation, especially under higher radial loads. The concentric locking collar provides a uniform grip to the inner ring leading to an operational true centerline, reducing vibration at higher speeds. As well, the concentric locking force significantly reduces the chance of damaging the shaft.

These one-step easy installation units are ideal for bi-directional applications and can replace both set screw locking and eccentric collar locking bearings.

- Cast iron housing
- Wide inner ring bearing
- Dual seals (Type B)

# Mounted Ball Bearing Units

## Inserts UC..T Premere-LOC Insert

The TRITAN Premere-LOC insert bearings and mounted units provide for quieter, smoother and more efficient operation, especially under higher radial loads. The concentric locking collar provides a uniform grip to the inner ring, leading to an operational true center line, reducing vibration at higher speeds. As well, the concentric locking force significantly reduces the chance of damaging the shaft.

These one-step easy installation inserts and units are ideal for bi-directional applications and can replace both set screw locking and eccentric collar locking bearings.

## SBLFPL Thermoplastic Two Bolt Flange Units

- Set screw locking
- Reinforced PBT housing - solid base
- Stainless steel narrow inner ring bearing
- Lubricated with food grade grease
- Dual seal (Type B)
- Supplied with end cap

# Rubber Cushioned Pressed Steel Pillow Blocks

## RPB Series

RPB

RPB S

- Conductive rubber interliner
- Used to dissipate static and reduce noise and vibration

### RPB Eccentric Locking Collar Type

## SAF Plummer Blocks

SAF Split Plumber Blocks are one of the most popular housings used with Spherical Roller Bearings\*. Their split design allows for easy mounting and maintenance. TRITAN SAF Housings are made of ISO Grade 200 (US Grade 30) cast iron, and a reinforced base with webs for heat transfer and ribs to help prevent deformation from over tightening. The housings feature 2 threaded plugged holes on top for a grease fitting and various testing equipment, and 2 drain plugs on opposite sides of bottom front face on units. Blocks are supplied with the popular Labyrinth Seals (LER)\*\* and a Stabilizing Ring.

\* 223 Series and 230 Series Spherical Roller Bearings are also used with SAF Plummer Block Housings, as are 12 and 13 Series Self-Aligning Ball Bearings

## Adapters

Adapters are the most commonly used components for locating bearings with a tapered bore onto a cylindrical seating, and can be used on on smooth or stepped shafts. TRITAN Adapters are supplied complete with locknut and lockwasher. Metric bore sizes are listed below. Inch bore sizes are also available from stock.

Bore Diameter (d)	Width (L)	Adapter No.	Outer Diameter	Locknut	Lockwasher	Weight Lbs
17mm	24mm	H204 X 17MM	32mm	KM4	MB4	0.090
20mm	26mm	H205 X 20MM	38mm	KM5	MB5	0.150
25mm	27mm	H206 X 25MM	45mm	KM6	MB6	0.220
30mm	29mm	H207 X 30MM	52mm	KM7	MB7	0.280
35mm	31mm	H208 X 35MM	58mm	KM8	MB8	0.380

# Bearings Accessories Series

## N-00 Series Locknuts

Standard Series in Inch Dimensions for ball, roller, spherical and tapered roller bearings. Also referred to as shaft or withdraw nuts, locknuts are used to locate bearings and other components onto a shaft, as well as facilitate mounting bearings, and dismounting bearings from withdraw sleeves. They are commonly used with W-00 series Lockwashers.

# TRITAN

**PRECISION BEARINGS AND POWER TRANSMISSION COMPONENTS**

Spherical Plain  
Bearings

Spherical Plain Bearings utilize inner & outer rings with spherical sliding surfaces, and can accommodate heavy radial loads & bi-directional axial loads at the same time. They are produced in a wide variety of designs & materials to satisfy diverse demands such as those in the automation, construction, mining, transportation, off-highway equipment, farming & machine tool applications.

Standard designs utilize carbon chromium steel on steel which is hardened, phosphated and treated with Molybdenum Disulfide (MoS<sub>2</sub>) to reduce friction. Most designs can be relubricated through annular grooves & lubrication holes in the outer rings.

Bearings are also available in self lubricating designs utilizing PTFE lined races offering a maintenance free solution with lower friction. For corrosive environments, many sizes can be supplied in stainless steel construction.

Common Interchanges (100mm Bore): GE100AW

# Technical Information

## Operating Temperatures

The operating temperature range for Spherical Plain Bearings with seals is -20° to +250°F. The operating range for Spherical Plain Bearings without seals is -50° to +300°F.

## Lubrication

Steel-on-steel Spherical Plain Bearings are coated with MoS<sub>2</sub> dry lubricant & can be operated without lubrication when the magnitude of applied load is small and the sliding velocity of oscillation is small. In other applications, it is necessary to lubricate periodically with grease or oil. During initial operations, it is recommended to shorten the lubrication interval. Lithium soap base grease (NLGI consistency No. 2) containing molybdenum disulfide (MoS<sub>2</sub>) is recommended as the lubricating grease.

When operating conditions are such that enhanced sealing protection against dust, contaminants or corrosive elements is required, the bearings can be effectively protected if the space around the bearing is filled with grease.

## Internal Clearance

Internal clearance is defined as the total distance through which one ring can be moved radially or axially in relation to the other ring under a defined load. It is necessary to distinguish between the clearance before it is mounted, and the clearance of a mounted bearing. The unmounted clearance will always be greater than the operational clearance because the rings are expanded or compressed by interference fits of mating components.

Bearings are produced with standard "normal" clearance so that when bearings are mounted as generally recommended and operate under normal conditions, a suitable operational clearance will be obtained. For other conditions; for example when both rings are mounted with an interference fit, or where unusual temperatures prevail; bearings with a greater or smaller internal clearance may be required.

Standard "normal" clearances vary by series. Contact factory if actual clearance data is required.

## Shaft & Housing Fits of Radial Spherical Plain Bearings

### Shaft Fits

Operating Conditions	Sliding Contact	
	Steel on Steel	Maintenance Free
Normal Operation - Clearance/Transition Fit	h6	h6, g6
Normal Operation - Interference Fit	m6	k6

Consult factory for actual values corresponding to above fits

### Housing Fits

Operating Conditions	Sliding Contact	
	Steel on Steel	Maintenance Free
Light Loads (axial displacement required)	H7	H7
Heavy Loads	M7	K7
Light Alloy Housing	N7	M7

## Tolerances

### Tolerances for Radial Spherical Plain Bearings

Unit: μm

Nominal Bore or Outside Diameter mm		Δ dmp Single plane mean bore dia. deviation		Δ Dmp Single plane mean outside dia. Deviation*		Δ Bs Inner ring width deviation		Δ Cs Outer ring width deviation	
Over	Incl.	Max	Min	Max	Min	Max	Min	Max	Min
2.5	6	0	-8	0	-	0	-120	0	-240
6	18	0	-8	0	-8	0	-120	0	-240
18	30	0	-10	0	-9	0	-120	0	-240
30	50	0	-12	0	-11	0	-120	0	-240
50	80	0	-15	0	-13	0	-150	0	-300
80	120	0	-20	0	-15	0	-200	0	-400
120	180	0	-25	0	-18	0	-250	0	-500
180	250	0	-30	0	-30	0	-300	0	-600
250	315	0	-35	0	-35	0	-350	0	-700
315	400	0	-40	0	-40	0	-400	0	-800

\* Tolerances apply to outer rings without surface treatment and splitting. The outer rings become slightly out-of-round due to splitting. The roundness is restored once it is fitted in a housing bore produced in accordance with the specifications. Measurements taken of the outside diameter of the unfitted bearing cannot be used as the original actual values for the outside diameter.

# Common Applications

## Heavy Equipment

### Dump Trucks

- Hinge Pin between truck bed & frame - GEZ Series
- Mobile Hydraulic Cylinders: Clevis on one or both ends of cylinder - GE/GEZ Series

### Front End Loaders

- Clevis/Shovel Connection - GEZ Series
- Articulated Joint - GEZ Series
- Mobile Hydraulic Cylinders: Clevis on one or both ends of cylinder - GE/GEZ Series

### Logging Machinery

- King Pin Assemblies - GAZ...SA
- Tie Rod - GEG or GEM (extended inner ring eliminates need for spacers)

### Shuttle Cars (Mining)

- GAZ...SA angular contact

### Wind Mills

- GAZ...Series angular contact

### Fork Lifts

- Steering Axle, Drag Link & King Pin on steering assemblies - GE/GEZ Series
- Tilt Cylinders guiding the forward/backward movement of the mast - GEZ Series

### Textile Industry Extractors

- Suspension rods (misalignment) - GE Series

### Overhead Carrier

- Eyebolt - GEZ & GAZ...SA angular contact

### Chain Conveyor

- Chain Link top plates - GEZ
- Chain Link anchor plates (thrust loads) - GAZ...SA

# CM Series Maintenance Free Male Rod Ends

Two Piece metal-on-PTFE construction offers an economical design for a wide range of light to heavy duty motion transfer applications. The PTFE Liner is self-lubricating and moisture resistant; and acts to minimize wear and extend life.

### Material

Ball: 52100/Hard Chrome Plated

Body: Carbon Steel/Zinc Plated with PTFE Liner

### Applications

Construction Machinery

Industrial Equipment

Lawn & Garden Applications

Truck/Bus/Off Road Vehicles

Recreational Vehicles

# TRITAN

**PRECISION BEARINGS AND POWER TRANSMISSION COMPONENTS**

Precision Power  
Transmission  
Components

## Precision Chain Technology

TRITAN is one of China's most technologically advanced chains. With advanced manufacturing utilizing CNC machinery, specialized heat treatment and testing, TRITAN Chain is produced to conform with ANSI B29.1, DIN8196 and JIS1801 standards and provides quality that was once only available from Japan or Europe. It is designed with a wide waist link plate, seam oriented bushings, link plates are shot peened and holes are ball burnished. These features improve wear resistance and provide greater fatigue strength.

## Packaging

TRITAN Chain is supplied in 10ft lengths in rust prohibitive boxes, and 50ft and 100ft reels. Custom chain lengths can be supplied upon request. Refer to How to Order.

## Connecting Links

- Connecting links are supplied standard with TRITAN Chain. 10FT Boxes will contain 1 standard connecting link, and reels will include 2.
- Additional spring type, cotted type or offset connecting links are available upon request.
- In normal installations an odd number of pitches/links of chain will require a standard connecting link (CL). These are available in both spring and cotted types.
- For an even number of pitches/links an offset link (OSL) should be used.
- Refer to How to Order for additional information on the use of connecting links in cut-to-length chain.

## Materials and Temperature Limitations

TRITAN Precision Roller Chain is constructed of high quality, heat treated carbon steel, and can be used at temperatures between 0°F and 350°F. As well it can be used at higher temperatures up to 500°F, however the load capacity decreases as the temperature rises. At 500°F the load capacity is approx 50% of normal.

Stainless Steel Precision Roller Chain is constructed of high quality 304 grade stainless steel, and provides an excellent solution for corrosive environments. Stainless Chain can be used at temperatures below 0°F and above 500°F. TRITAN Chain is also produced in Nickel Plated and Dacromet coated varieties, ideal as an economical solution for humid environments and washdown applications.

## How to Order

To order roller chain, the following information is needed

**Size:** Specific Pitch, and ANSI or ISO/BS

**Type:** Standard Riveted or Cotted

**Quantity:** Chain length in either in feet, or number of pitches/links.

Chain is normally available and sold in 10ft boxes, 50ft reels, and 100 ft reels.

If ordering chain with attachments, the spacing of attachments must be specified.

## Made-to-Order / Cut to Length Options

### Roller Chain with a connecting link(s)

When the number of pitches is even, a connecting link is needed  
Example: 40-1R x 8p + CL

Even pitch lengths can also be used with a connecting link at each end.

### Roller Chain with an Offset Link

When the number of pitches is odd, an offset link is necessary  
Example: 40-1R x 9p + OSL

The odd pitch length can also be used and ordered as Roller Chain with Roller Links on each end, where no connecting link will be used.

### Endless Chain

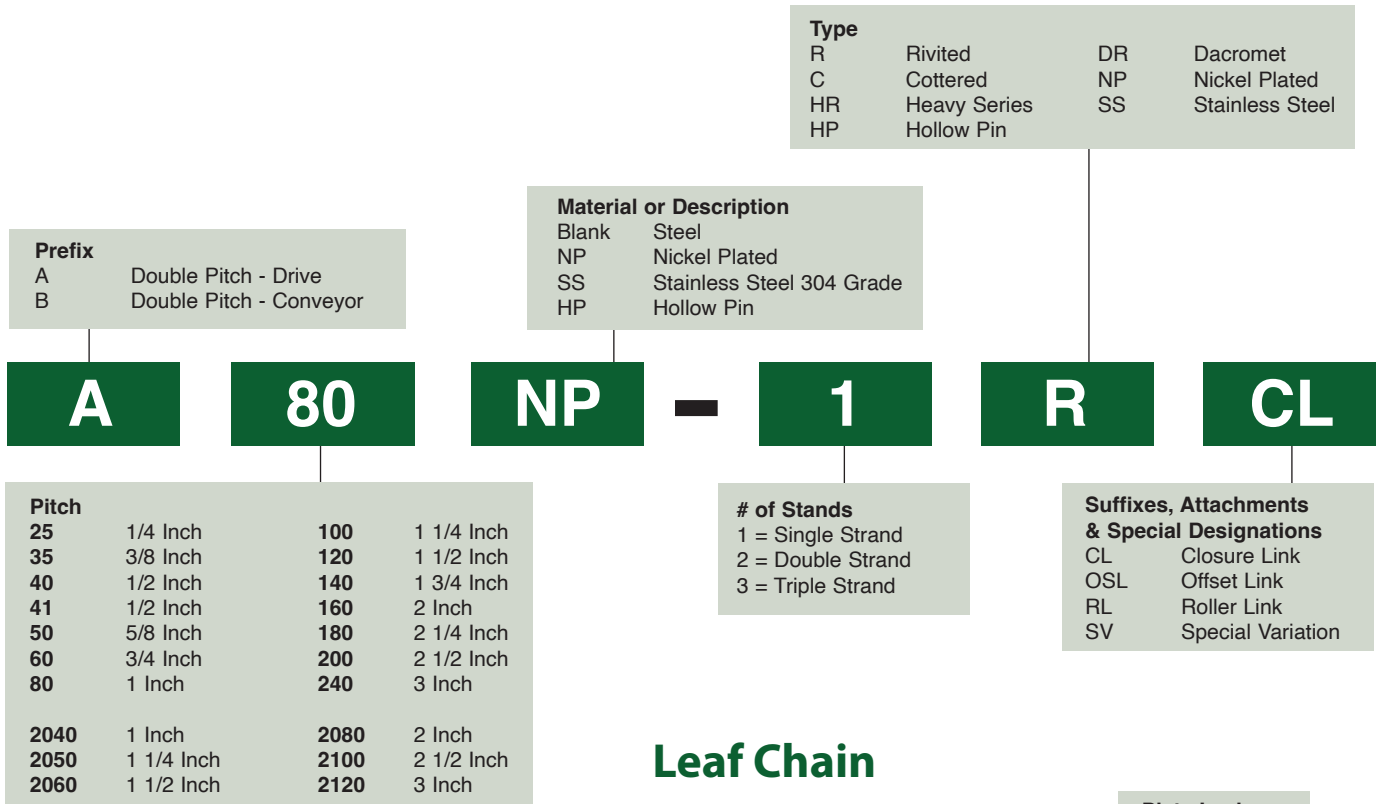

Endless Chain is delivered as a continuous loop, and is typically factory riveted with no connecting link.

Specify the EVEN number of links and "Endless"

Example: 60-1R X 20p Endless

# ANSI Precision Roller Chain - Cotted

TRITAN Cotted Chain has the same strength and dimensions of standard riveted chain, except that the pin length is slightly longer to allow for the cotter pin. Cotted Roller Chain has the advantage of being much easier to break apart; no need for grinding pin heads. This is ideal for applications where field assembly and disassembly is common.

# ANSI Heavy Series Precision Roller Chain

TRITAN Heavy Series Roller Chains have increased link plate thickness to provide greater capacity without fatigue failure. These link plates have the same thickness as the link plates of ANSI chains having the next larger pitch. The thicker link plates provide greater capacity for absorbing shock loads. These chains are suitable in situations where the load is heavy or operating conditions are severe.

# Corrosion/Moisture Resistant Precision Roller Chain

To address the power transmission needs in the food processing and pharmaceutical industries, as well as a wide variety of applications in hostile environments, TRITAN produces corrosion resistant precision roller chain.

## Stainless Steel

TRITAN Stainless Steel Roller Chains are used in highly corrosive and high temperature environments. Constructed of 300 grade stainless, this chain offers optimal performance in caustic & wash-down applications.

## DR Series - Dacromet Coated Chain

TRITAN Dacromet Coated Roller Chain is the perfect choice where corrosion resistance and high strength is needed. Designed to provide maximum resistance to harsh environments, including salt water, fertilizer, and chemical wash-down, that is far superior to nickel plated chain, while maintaining the strength and durability of carbon steel chain. Dacromet Chain is ideal for corrosion prone applications such as car wash, packaging, wash down, and other outdoor service. It not recommended in applications where chain may come into contact with food; Stainless Steel Chain is recommended if food contact is possible for maximum corrosion resistance.

## NP Series - Nickel Plated Chain

TRITAN Nickel Plated Roller Chain provides an economic, high strength solution in mildly corrosive environments. While maintaining the strength of standard carbon steel roller chain, the nickel plating will improve overall life in a wide variety of applications such as food processing equipment, textile machines, business machines, and printing machines.

# Hollow Pin Precision Roller Chain

Hollow Pin Chain is identical to ANSI roller chain running on standard ANSI sprockets but with a hollow pin. The unique “hollow” pin feature provides for conveyor versatility, allowing easy insertion of cross rods or attachments at desired spacing.

ANSI Chain Number	Pitch P	Roller		Plate		Pin Diam.		Overall Width		Average Ultimate Strength (Lbs.)	Average Weight per Foot (Lbs.)

# British Standard Chain (BS/ISO)

TRITAN British Standard Chain is manufactured to the same high quality specifications as our ANSI chain. Solid bushings and solid rollers dramatically increase chain life. Manufactured in accordance with ISO R606, British standard chains are compatible with British standard BS 228 and German standard DIN 8187.

BS/ISO Chain Number	Pitch	Roller Diameter	Width Between Inner Plates	Inner Plate Depth	Plate Thickness	Pin Diam.	Pin Length		Transverse Pitch	Average Ultimate Strength (Lbs.)	Average Weight per Foot (Lbs.)

# Double Pitch Roller Chain

TRITAN Double-Pitch Roller Chain is similar to standard roller chain, except the pitch is twice that of standard roller chain. These chains weigh less and are lower in cost than standard roller chain of the same strength. They are ideal for slow and moderate speed applications, particularly when shaft centers are relatively long, such as material handling equipment, road building machinery, textile machinery, farming implements, baking, packaging, and bottling equipment.

## Drive/Transmission Series

These chains, produced to ASME/ANSI B29.3, have figure-eight style link plates, and are similar in dimensions with the exception of the pitch. The increase in pitch means that only half the number of component parts are required per foot which can significantly lower the cost. Typical uses for these types of chains include light load drives commonly found in agriculture.

ANSI Chain Number	Pitch P	Roller		Plate		Pin Diam. d2	Overall Width		Average Ultimate Strength (Lbs.)	Average Weight per Foot (Lbs.)

TRITAN Conveyor Chain is similar to the Double-Pitch Drive/Transmission chain, but with link plates that have a flat side and oval contour (not figure-eight) and are produced with either standard or over-sized carrier rollers.

## Standard Roller

# Leaf Chain

TRITAN Leaf Chains are built of interlaced plates held together by rivet pins. They are used for applications that require strong flexible linkage for suspension, counterweight, and/or transmission at low speed. The first number or numbers in leaf chain identifies the chain pitch, the last two numbers identify the chain's lacing.

## Precision Roller Chain Sprockets

All TRITAN Sprockets are manufactured to ANSI B29.1 and BIS Standards using the highest quality control procedures. They are constructed of solid, high quality carbon steel and are supplied with a black oxide finish. TRITAN Sprockets can also be supplied in 304 Stainless Steel.

## Hardened Teeth

Depending on pitch & diameter, small pitch sprockets with up to 20 to 40 teeth are produced with hardened teeth (45-50 HRC), as standard. Hardened teeth provide for greater chain & sprocket life. Sprockets with hardened teeth are identified in dimensional tables with the suffix H.

## Hub Types

Sprockets are supplied in several different hub types, each designed for specific needs. The following are the basic & most common type.

### A-Type

A-Type sprockets have no hub and are often referred to as "Plate Sprockets". They are typically supplied with a plain bore (no keyway or set screws) and must be mounted on a flange or hub, or other holding device.

### B-Type

B-Type sprockets have a hub extending on one side only. This type of hub is typically found on small & medium sized sprockets, and can be supplied with a plain bore, or with a keyway and set screws. B-Type sprockets delivered with keyway & set screws are also referred to as BS type sprockets indicating "Bored to Size".

### C-Type

C-Type sprockets have centrally located hubs that extend in equal distance on both sides. These are common on large diameter sprockets. As with B-type they can be supplied with a plain bore, but are commonly supplied with a key way & set screws.

### C Offset - Type

These are the same as C-Type sprockets except that the hubs on each side extend at different distances causing the wheel to be off center.

## Hub Dimensions

Hub sizes will vary with bore size and pitch. Specific hub dimensions can be found in sprocket dimensional tables. Hubs for sprockets with a low # of teeth will have a recessed groove for chain clearance. Refer to dimensional tables for specific sizes & groove dimensions.

## Keyways & Set Screws

A single Keyway and 2 Setscrews are furnished as standard on finished bore (also referred to as bored-to size) BS & CS type sprockets, unless otherwise specified. Setscrews are placed over the keyway and at 90 degrees to the keyway, and are supplied with locking tape. Standard Keyways are located on the center of tooth. Variations from this arrangement can be supplied upon request. When keyway & set screw dimensions are not specified, they are supplied in accordance with the "Standard Keyway & Set Screw Table" (see Inch and Metric tables on next page).

## Boring & Bore Tolerances

TRITAN sprockets are most commonly supplied with finished bores, but can also be supplied with a Minimum-Plain-Bore (MPB) for customers who desire to do their own machining. Customers ordering Hub Type (B- & C-Type) sprockets who desire a plain bore should specify this when ordering.

Tolerances for Sprocket Bores	
1" and under	-0 / +.001"
Over 1" to 2"	-0/ +.002"
Over 2" to 3"	-0/ +.003"
Over 3" to 4"	-0/ +.004"
Over 4"	-0/ +.005"

Abbreviations

# High Speed Ball Bearing Idler Sprockets

The following are the common ball bearing Idler Sprocket sizes. All are produced with hardened teeth and utilize a quality deep groove ball bearing that is lubricated for life with multi-temperature quality bearing grease.

ANSI Chain Size	No. of Teeth	Part Number	Diameter			Length Thru L	Width W	Approx Weight Lbs
			Bore Size B	Outside Do	Pitch Dp			
35	20	35BB20H	0.638	2.590	2.397	0.72	0.17	0.38
40	17	40BB17H	0.638	2.980	2.721	0.72	0.28	0.52
40	18	40BB18H	0.638	3.140	2.879	0.72	0.28	0.53
50	15	50BB15H	0.638	3.320	3.006	0.72	0.34	0.75
50	17	50BB17H	0.638	3.720	3.401	0.72	0.34	0.78
60	13	60BB13H	0.638	3.490	3.134	0.72	0.46	0.76
60	15	60BB15H	0.638	3.980	3.608	0.72	0.46	1.06
80	12	80BB12H	0.750	4.330	3.864	0.61	0.58	1.50

Made-to-Order Idler Sprockets can be produced in various bore sizes, with ball bearings, needle bearings, or other non-rolling bearings

# 06B Sprocket - ISO

Produced in accordance with ISO/BS228/3 Standards

# L Series Jaw Couplings

TRITAN Jaw Couplings provide standard shaft-to-shaft connection for general duty applications. Two hubs are used in pair with elastomer element (spider), each sold separately. The element eliminates metal-to-metal contact and acts as a shock absorber. The design is "fail-safe" in that it will still perform if elastomer element fails.

Produced with a black oxidized finish, these couplings are resistant to sand, dirt, oil and grease.
